I'll second that. I've got one here I won for $200 and it needs work, but I was expecting that.

Yep, I paid far more than that, for a TR4, with issues. GREAT DEAL!!

I have a friend who has had cancer twice. Different
kinds not a recurrence. She had the predisposing conditions
for neither. So, no, you can't tell. But statistically the
occurrences of cancer do follow all sorts of predisposing
conditions so it pays to avoid things that have proved to be
dangerous.

Richard,
I am beginning to believe that the real cause of cancer in California, is the cancerous atmosphere, in California. And I don't mean the highly polluted air that we breathe.

That is NOT how the warning is worded, it is: This
product contains substances which are known by the State of
California to cause cancer". There is a similar warning on
businesses here that use cancer-causing materials.
Wait until someone you love comes down with cancer or
are diagnosed with it yourself, it will change your mind
about nanny state control of cancer causing substances.

13299. Re: TR-4 Repair (Added)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-20 17:47:11 UTC
From: slowcountry1
Topic: 13108 Message: 13299

Garey,

Ok, T9 had a 53pF cap inside. I changed it to 41pF and now the can tunes correctly. I went back through and the adjustment of the mixer and RF coils and peaked all of them.

I removed the plate and screen leads and used the load as directed to adjust the injection couplers. I cannot get an S-Meter reading on either 15M or 10M while doing this. 15 and 10 are very quit on receive, volume has to be all the way up and strong signals are still faint.

With the selector switch in Cal, the S-Meter produces readings on the following bands;

80M S9+30
40M S9+10
20M S7
15M S1
10M no S reading change.

The receiver appears to work good on 80, 40 and pretty well on 20. !5 and 10 seem dead.

I went back through the rig and again loosened and tightened every screw, have done this several times. I have looked at T1, T2 and T3 and it does not appear that these have been touched. I have looked through the rig and don't see any modifications other than the ones that I have fixed.

Several weeks ago, I cleaned all of the band switches. Do you have a direction to point me in to look for the deficiency on 10 and 15M?

Thanks for all of your help,

Doug N9XTF

Doug -

Progress!

Have you checked the BAND oscillator? Swap V1. Do you get a strong negative voltage on TP? Does it peak with L1 or L2 as expected? Does RF TUNE peak as it should? If you can't get a meter reading, you should be ableto hear the signal on an external receiver andtune for loudest signal to verify tuning. Do all the adjustments in Section VIII, para J peak as they should? Again if you can't get plate current, tune for max signal in an external receiver.

The problem(s) have to be in this area. Did you get access to a scope? Makes these types of problems much easier to track down. You can compare the input and output of various stages to see if you have gain or perhaps loss onone or more bands. And be sure the BANDoscillatoris running strong on the higher bands.

And, Garey, perhaps if Mr. Drake, had been prone to imbibing barley pop, from the "Glass lined tanks, of old Latrobe" (aka Rolling Rock), he might have preferred to begin ALL of his serial numbers, with the number 33.

In tough economic times, it is purported to be beneficial to invest in precious metals, like platinum, gold and silver. Personally, I choose to invest in blued steel, brass, and copper jacketed lead.

13302. SPR-4 TA4 Update

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-21 08:16:46 UTC
From: taner@btinternet.com
Topic: 13302 Message: 13302

The mystery transformer is an impedance step up transformer and nothing to do with a TA4.

Wiring on one side (secondary)is in parallel with the speaker output socket.
The other side (primary)is connected to a headphone socket at the front and also,in parallel to a 4 pin add-on socket at the back with 4 female receptacles (only 2 are wired),

So I do not have a TA4 (location is empty anyway).

Thanks to all who replied/sent diagram and pictures.

Paul,

If you find the schematic, I would very much like to have a copy. I'd like
to build a solid state TR switch to use with my station.

Have for sale a 1970 model Drake TR-4 excess to my needs now. Serial number 31977. It has the matching speaker, MS-4, with it. It is in excellent condition. It has the PNB-34 noise blanker,new Sylvania 6jb6a final tubes,Heil 5.1 conversion in the D-104 mic,Heathkit shop mod. in AC-4 power supply. Also have with it a DD-103 Univerisal Digtal Dial by Electronic Speciaty Products. It has been serviced by Dave Harmon [K6XYZ] a Drake and Collins expert or anything with tubes in it. He said it had never had a solder iron to it till he put the finals in. On his bench on 80 meters he had 220 watts out of it. He said it looks like it just came off the line. It is just as good as his TR-4CW he bought new. He is good on QRZ if you want to contact him. I am asking $700.00 plus shipping for it. Contact me offline at my email address. Thanks.

Terry,

I can get close (I think). I believe that to be a "transmit adapter" to allow the SPR-4 to work with a transmitter (hopefully Drake, hi). If I'm wrong, I'll get corrected, but I think that is close.

Don -

You gots it! :-) It's a small board that fits in the SPR-4 to allow it to transceive with any of the T-4 series transmitters. Basically it controls the PreMixer in the SPR-4 as is done in the R-4 series to enable transceive in either direction, just like the twins. Fairly rare item but would be easy to replicate. Just a half dozen small-signal transistors and no transformers or other special parts.

Terry,

I don't know if Garey has any info on the TA-4, but I suspect the schematic can be found on the internet and from Garey's description, it should be simple to replicate. Glad I could help, as I actually lived during the time of the SPR-4, and should have been in the gray matter somewhere, hi. I read ALL the catalogs at that time, as a 10 year old didn't have close to the amount needed in the late 50's to ever buy one, hi. Nice rigs though.

From: dohafisher
Topic: 13313 Message: 13313

Just got a T4X replaced the electrolyics and paper caps, new power supply kit from Paul Kraemer. My question, is there a quick and easy tune up prodecure? I haven't found where to preset the plate. I've went thru the prodecure in the manual but although I'm getting indications on the Drake meter, I have no output on my power meter. I think I'm just not getting it tuned up correctly. Any help or tips would be appreciated.

Thanks
Doyle

From: Garey Barrell
Topic: 13313 Message: 13314

Doyle -

There is a very comprehensive tune up procedure in the manual for the T-4X. If you follow it, it will tune up fine.

Essentially what you have to do is start with the LOAD control at 0. Set the PLATE control to about 4. Preset the RF TUNE control in the band indicated for where you have the BAND SWITCHset. Set theGAIN control to about 10 o'clock.

Key the transmitter in TUNE, while watching the plate meter and adjust the RF TUNE to where the meter kicks up. It should peak in or very near the area marked onthe dial. Immediately adjust the PLATE control for MINIMUM on the meter. Unkey the transmitter. Wait a minute, then key it again, re peak the RF TUNE, and re-dip the PLATE. You can increase the LOAD control at this point, the meter will go up and again adjust the PLATE for MINIMUM. Keep going back and forth like this until increasing the LOADcontrol no longer increases the PLATE meter. This should be around 350 mA, and about 130W output on 40M if you have good PA tubes.

The ONE THING to remember about all that above is the FIRST and LAST thing you do is 'dip' the PLATE control (adjust for minmum on the PLATE meter). If at any time the meter does NOT 'dip' when the PLATE control is adjusted, un-key the transmitter immediately and find out why. Typical causes for this are 'wrong antenna', 'no antenna', 'bad antenna coax', and like that. Do not key again until you find out what's wrong. It's ok to key quickly and adjust PLATE quickly when you think you've found the problem, but be ready un-key immediately if still no 'dip'.

If you do this, your PA (6JB6) tubes will last for years. If you don't, they won't last out the week!!

If you don't have a manual, get one. My CD for the T-4X transmitter and R-4A receiver has high resolution PDFs of the original manuals along with a lot of other stuff you'll find very handy if you work on your radios. It costs less than many charge for a single print of one manual.

13316. TR-7 / PS-7 HELP!!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-22 17:09:34 UTC
From: Garey Barrell
Topic: 13316 Message: 13316

A week or so ago I posted about a failed PS-7 power supply. Four new pass transistors and on driver transistor resolved that problem, and the supply now puts out 13.75 VDC from zero to full load. This is the latest version (1980) supply with the SCR components on the PC board and the 0.22 cap across the transformer secondary. The TR-7 is also a fairly late one, 96xx something. The PA has the Version 2 Predriver with the MRF476.

I connected PS-7 to the TR-7 it was driving before, and everything came up as it should. However, (there's ALWAYS a 'however',) increasing the Carrier control results in about 100 watts out on five bands, but the ALC light never comes on and just about the time the wattmeter indicates 100W the power supply trips off. Turned off and back on, everything is the same, so I assume this is the small SCR in the regulator board firing for 'some' reason.

I know there has been a lot of discussion about these pieces, and I wonder what the consensus has been.

Stupid three-legged fuses......

Hi Gary,
It maybe a Duff MRF 475 on the predriver board, as that can suffer thermal runaway, and the transistor suffers,
This is perhaps the reason for the No ALC light.
re tripping out... that sounds more ominous, but that maybe due to the MRF 475 as well, just drawing too much current,
40m tends to be where they trip easiest.

FWIW

Garey,

There is something "from the past" trying to come to the front of this old brain, but (and you are so right, there always is a "but") one question and a suggestion. Question is, did you try another TR7 (I assume all of us has more than one, HI) to see if it acts the same or "normal". Something is trying to tell me that those very small value emitter resistors on the pass transistors can cause this IF one or more opens??? It's been a LONG time since I have been into a PS-7, but I find them open on Astron supplies all the time.

I'll keep working on the "brain", but it's nearly shot at this point.

I've never worked on one of these, but linear supplies are pretty similar. How's the current-sensing resistor?

Most other supplies I've worked on over the years use a latching SCR circuit for overvoltage but this sounds like it's latching when the voltage is sagging.

Subject: [DrakeRadio] TR-7 / PS-7 HELP!!

A week or so ago I posted about a failed PS-7 power supply. Four new pass transistors and on driver transistor resolved that problem, and the supply now puts out 13.75 VDC from zero to full load. This is the latest version (1980) supply with the SCR components on the PC board and the 0.22 cap across the transformer secondary. The TR-7 is also a fairly late one, 96xx something. The PA has the Version 2 Predriver with the MRF476.

I connected PS-7 to the TR-7 it was driving before, and everything came up as it should. However, (there's ALWAYS a 'however',) increasing the Carrier control results in about 100 watts out on five bands, but the ALC light never comes on and just about the time the wattmeter indicates 100W the power supply trips off. Turned off and back on, everything is the same, so I assume this is the small SCR in the regulator board firing for 'some' reason.

I know there has been a lot of discussion about these pieces, and I wonder what the consensus has been.

Stupid three-legged fuses......

The MRF-476 is a good place to start. The emitter resistors mentioned by others as described in Drakemods should be done. It doesn't hurt. RF Parts has the transistors. The TR-7 PA rebuild article on WB4HFN's site is a good read, if you haven't already.

My TR-7 was acting all sorts of strange and wanting to take off due to leaky driver transistors on the PA board. You should have 0 volts on the base in RX mode. You know how to test those "fuses".... :)

Garey,

One of the first things I did was check the band oscillator. All of the voltages to TP were positive so I adjusted L1, L2 and L5; I was able to bring them down but only close to zero, could not obtain a negative voltage. I swapped out V1 with a used tube and got 40M to -.39VDC 15M to -.43VDC and 10M to -.42VDC. I did not have a new tube so today I replaced V1 with a new Amperex 6U8A tube that I had (I tried the tube from V3 it wasn't any better). I was then able to get 40M to -1.512VDC 15M to -1.482VDC and 10M to -1.34VDC. For smiles and grins, I replaced V3, assuming it was soft, with a new Amperex 6U8A tube. I have a bunch of these from a sale somewhere but I didn't have any 6EA8 new replacements.

One point of note, when I have the switch in Cal, the tone produced from the speaker changes significantly if I touch or have my finger near the V1 tube.

RF tune peaks signals on all bands as I expect it should.

In calibrate mode, where should I put a wire coil to listen for 10M and 15M on a separate receiver? In section E, I tuned T-2 and T-1 for loudest tone out of the TR-4 speaker.

After repairing T7 and T9, section J alignment all peaks as I understand it should.

I went through and touched up a few solder joints that looked suspicious but have been unable to find or fix any other problems. 15M and 10M receive still appear very very weak. (Volume all the way up and strong signals very hard to hear with no S-meter deflection.)

I have not been able to source an O-Scope yet.

At this point, I'm pretty much stuck in the mud.

13325. Is there a modern TR7 noise blanker?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-23 04:37:58 UTC
From: Jim Pruitt
Topic: 13325 Message: 13325

Can anyone tell me if there is a modern noise blanker for the TR7 or a circuit that would work? I know that the orginal is not considered that good by today's standards but I have not seen any homebrew ones or any homebrew circuits to use. I have 2 TR7's and would like to ad that option but not at the prices the NB7 and NB7A seem to command.

Thank you.

Hi Jim.

What types of noise is it good with? The woodpecker? Does it work for static crashes or electric fence/thermostat/touch lights/power line noise/etc noise?

Great or not, it is really spendy so I was hoping there was a more modern circuit that could be homebrewed as I think an NB7 would be a bit much to homebrew today with at least a few parts obsolete. Yes I know, the life cycle of even a new recently released part is 6 months or less today so obsolete may or may not mean much but if the part is hard to find (or impossible) then the results are very iffy, at least for me and the projects I have tried from a bygone period.

Thank you.

Jim,

I do agree that the NB7 is VERY pricey, but it is the best for taking out my electric fence "popping" AND it does it with little to no distortion of the incoming signals, even if they are strong. All the "modern" noise blankers, even the very complex ones that are variable and even with "NB1 and NB2" presentations do distort greatly, especially when you are receiving strong signals on the band with the weak ones. I think the NB7's are much superior to the others I have on hand.

Now, noise reduction (labeled NR or DSP on modern receivers) is a very different animal, but these also distort at least the background so they are not clear like the NB7 on the same noise.

Just my .02. Probably not worth that much, hi.

Most tool and home improvement stores sell small tool compressors (for nail guns and the like) with tiny 1-3 gallon tanks in this price range. I use such a compressor (mine happens to be a DeWalt out of compressor/nailer combo kit) for this duty. It's nice because it's small and can be easily carried either to the workbench or out in the driveway, depending on how filthy the item is, but it is quite loud and the 2 gallon tank depletes rapidly if the pressure regulator is wide open. The compressor, a shop vac, and a paintbrush constitute my "initial cleaning" of most electronic items.

Ethan

I forgot to mention that the reason for this kind of compressed gas, rather than air, is due to lack of humidity. I realize that you want to avoid the canned stuff. I guess that is because of some being pretty ineffective. I've had that experience, too. The one I mentioned in the previous email, has served me well, for years.
I got in a hurry to hit the send button, before mentioning why I was recommending against your request.

Dan, you will be rather unpleasantly surprise when you go to buy another case of that stuff. The price of canned air has gone up dramatically in the past several years, partially due in part to the kids who huff the stuff in order to get a buzz.

Airheads.

Well, I won't blame the messenger for the message, but you just made my day go downhill, a bit, with hat news. It has been a while. I guess, when I set up my new shack and shop, at he Oklahoma house, I'll have to spring for a de-humidifier, for my Craftsman compressor. I thank you, for the otherwise bad news, and apologize, for making a poor recommendation.

My hand is extended, for the requisite "wrist-slap". Hi-Hi!!!

>noise/etc noise?

There's not much that does work on static crashes. A good DSP will help, but only to a point. The blankers in my TR-7 and R-7A are very effective on the intermittent power line noise that troubles my city location. They make the difference between an S-7 buzz saw and copying all but the very weakest of signals. Yes, with some distortion, but the alternative is not making the contact.

Jim -

Yeah, I had forgotten about the MRF476 Emitter degeneration. Sounds like a great place for a thick film SMD resistor.

My PS-7 problem has gotten worse. The tripping off at about 100W turns out to be an open current equalizer / current monitor0.18 ohm 15W resistor. I was able to adjust the current limit up to allow 150W output, but one of the 2N5302 pass transistors area of the heat sink wasn't getting warm! :-) Yet another hard to find item. I've found 0.18 ohms at 10W, (from Radio Shack no less,) which may be the best that I can do. There'd be about 7W at 25A load, so not too bad. It's also down against the chassis divider which should pull a little heat away.

The radio seems to be doing well, key down forseveral minutes and no heating of the MRF476 heatsink.

Nothin's ever easy....

In attempt to redeem myself, from the earlier Faux Pas, I will send this, that I found. It looks like it would fit the bill. It has a nozzle for blowing, or can be used for airing up tires. Being 12VDC, you could likely wire it to your power supply, for any 12VDC rigs and accessories you may have near the bench.

Don -

Thanks for the tip. I was able to keep it from tripping by increasing the current limit setting, but sure enough the areaof the heat sink around one of the pass transistors was NOT warm after several minutes transmitting at 150W output.

Unfortunately, 0.18 ohm, 15W resistors ain't easy to find. The closest I could find was 0.18 ohms, 10W from Radio Shack! With 25A load, that's about 7W dissipation in one of those resistors, so 15W is 'right', but 10W will probably do. It will be hard up against the divider shield, so that should move some of the heataway. I do have a fan on the supply, so shouldn't be pushing things too far.

Onward and upward!! :-)

My experience with those 12V compressors is that the volume of air they produce is not nearly sufficient for things like cleaning. They take a minute or two to inflate a car tire to 35 PSI from 30 PSI. They normally say they're capable of 100+ PSI, but I assume that is the ultimate pressure they will develop in an infinitely small pressure vessel just before heat death of the universe.

Dan is correct that using a compressor will usually result in moisture mixed with the air. This is a problem when I use my compressor to do sandblasting. Fortunately there is an attachment called a water separator that seems to do the trick.

For vacuuming of a chassis I bought a micro vacuum attachment kit from Harbor Freight, p/n 32994. The extension and brush tubes are about 3/8 inch in diameter and these can get into pretty small spaces. The tubes have a tendency to not stay together so I keep a roll of blue painters tape handy. The adapter to a "standard" vacuum hose only fit one of the vacs in my house. Most woodworking supply houses, and maybe Home Depot, have a rubber mutli-stepped hose adapter that can be used to adapter many hose combinations.

Most tool and home improvement stores sell small tool compressors (for nail guns and the like) with tiny 1-3 gallon tanks in this price range. I use such a compressor (mine happens to be a DeWalt out of compressor/nailer combo kit) for this duty. It's nice because it's small and can be easily carried either to the workbench or out in the driveway, depending on how filthy the item is, but it is quite loud and the 2 gallon tank depletes rapidly if the pressure regulator is wide open. The compressor, a shop vac, and a paintbrush constitute my "initial cleaning" of most electronic items.

Curt:

Two words: Harbor Freight.

or, another two-word answer: Northern Tool.

Both have inexpensive "hotdog" compressors that would do the job.

I tend to run the pressure at about 50 - 60 psi when blowing out dust or drying out a washed chassis.

Curt

I recently started restoring a 2B, and found info about the knobs here:

http://www.mail-archive.com/drakelist@.../msg07114.html

Actually, I got lucky - the knobs weren't rusty, just well-coated with nicotine. They cleaned up very nicely after a good soak.

Also, I've found that household cleaners don't do much for restoring the finish of the chassis, they only clean the crud off. I'm hesitant to use any low-abrasion copper cleaner, as it's most likely to remove the tube markings as well.

I've got to agree with Jim; I've found the TR-7 NB to be very effective, probably one of the better implementations I've ever used. Even many late-production analog blankers leave a lot to be desired.

Excellent noise blanking can be achieved with software-defined receivers, or receivers that have a DSP last IF, but it has to be inside the AGC loop - something you won't be able to accomplish with a DSP filter that connects to the AF output.

Hi,

I ended up with two TR-7's, one with the DDS VFO and
one stock. I'd like to sell the stock TR-7 (S/N 1275).
it comes with the Drake hand mic and a power pole <->
radio power adapter for use with a 12V supply.
It functions perfectly. It's very clean cosmetically
except for a couple of scratches and paint oxidation on the right side. I have pictures.

I also have a nice used once (in my other TR-7)
INRAD 1.8khz SSB filter as well as the VFO module
that was replaced by the DDS.

Does anyone have an opinion on what I should ask for this stuff?

If you're interested contact me offline.

Thanks,

Jon

To clarify, I use the shop vac as a vacuum, not as a blower. A small paintbrush gets the dirt loose and the vacuum hose sucks it up very well. No added moisture and no dirt scattered everywhere. I've done it this way for 30+ years on all sorts of electronics from broadcast transmitters to computers. I have a blower but the main use it gets is to clean the shop vac's filter outdoors.

I have a Clearspeech Base that I use with the 7-line. It doesn't do anything for the buzz saw, but with atmospherics, system noise (hiss), and static crashes it ranges anywhere from mediocre to amazing. I sometimes use it in conjunction with a classic Autek QF-1A. I recently acquired a gadget called a Jabco Voice Gate that may prove interesting, but likely will not add much to the overall system.

Jim,

That's the same setup I use...an Autek QF-1A and a Clear Speech Base Unit. The Clear Speech drops the noise floor by at least a full S unit, and with the single or double notch on the Autek, plus any audio manipulators I have on whatever rig I'm running, it makes any old rig sound like a new multi-thousand dollar radio. I can't remember which of the units I have in-line first, one feeds the other, then the output is sent to a 10 inch 8 ohm speaker. I can run several radios this way by simply having an input presence on a patch panel into the audio chain, and from there, use a long cord with a 1/4 inch plug on one end and plug it into any headphone jack in any receiver. It even improves the old Drake 2-B!!

You're the only other ham I've known that also uses the Clear Speech - Autek set-up. To really dig deep, I simply plug in headphones instead of the 10 inch speaker.

Happy hamming!!

Bernie,

I'm sure you mean "relative" S-Units, since the Clearspeech is in the audio chain... :) Yes, it can be quite effective. I have the QF-1A feeding the Clearspeech. Sometimes a little pre-tailoring of the audio helps the DSP cope with the noise. The Jabco I picked up looks like it mostly duplicates the functions of the QF-1A, but it has a variable noise gate (squelch) with blending capability (to let a little of the nosie through if desired), and an audio expander. I'm really interested in what the expander portion can do. Never tried one on a radio. It also has the quaint ability to feed a tape recorder and trigger the recording via the noise gate. With the capabilities available in today's computer recording software, that's probably enhanced uselessness, but there is still a bit of a cool factor there. I had never seen or heard of one of these things until I spotted this lonely sample on that auction site, with no bidders. I was able to contact the guy who built them through his web site and he sent me an electronic copy of the manaul.

13358. Re: [DrakeRadio] My non-working TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-24 05:12:18 UTC
From: Howard Traxler
Topic: 12538 Message: 13358

Hello again Garey,

Finally got the XYL down there to watch the meter while I fired up the TR-4 as you suggested. I think she's getting a bit tired of my TR-4. Wish I could find an effective way to check it myself.

In any case, setting it up as you say (below), listening on a nearby receiver, there is a signal increase when I move the RF Tune and Plate Tune and not so much when I increase the drive gain. Plate current does not rise from the 100 ma biased point.

Does that give you any ideas what to check next? Will the xmtr not working cause the rcvr to not work? That's the first thing I noticed; the receiver went dead

Thanks, Garey.

Topic: 13325 Message: 13360

Guys -

I remember going to Dayton around 1991 where a couple of guys had a
booth inside the main hall. They were introducing a little black and
white box that was something called a 'DSP filter'. They had a bunch
of recordings of various band conditions, SSB and CW, lot of noise,
QRM, etc., etc. Then they would push one or more buttons on the 'box'
and the garbage went away! Pushthe button again, it was noisy and
almost unintelligible again. The most impressive trick was another
button that was pushed when there was a heterodyne tone nearby. Push
the button, the tone disappears!! Notuning, no 'notching', just GONE!
After three or four cycles of this on SSB and CW, the crowd around the
booth couldn't pull their money out fast enough!! This was the DSP-9
from Timewave, and I believe was sold at $220.

The DSP-9+, DSP-59 and DSP-59+ came along in due course, and I got a
DSP-59+ when it was introduced a year or so later, and still have it.
The 59 used the same DSP set, but had more controls and buttons,
giving more flexibility inbandwidths, noise reduction amount, etc.,
plus an RTTY regeneration feature that was very powerful. It took a
noisy RTTY signal, cleaned it up, and then keyed an internal tone
generator to output the 'clean' RTTY signal.

Hello Don.

It might be true that the NB7 is and was a great noise blanker but I see very few come up for sale and seldom when I have the money to buy them. Even then I have only seen them on ebay and they seem to go for a lot more money there than I am willing to pay. That is what prompted the question as I do not mind building something and actually prefer that option but I have not seen anything about building an NB7 or clone but have seen K8AC's version of the Aux7. It looked like just building an NB7 from scratch might be a bit hard with some parts no longer readily available and that was what prompted the question. I have one rig that has noise blankers in it and absolutely hate it because it distorts very badly but find that I do often need something since I get electric fence noise or steady buzz from some touch lamp or doorbell transformer or similar and neither of my TR7's have noise blankers. So I am on a quest to find something.

Thank you.

Jim Pruitt

--- In DrakeRadio@yahoogroups.com, "Don Cunningham" <donc@...> wrote:
>
> Jim,
>
> I do agree that the NB7 is VERY pricey, but it is the best for taking out my electric fence "popping" AND it does it with little to no distortion of the incoming signals, even if they are strong. All the "modern" noise blankers, even the very complex ones that are variable and even with "NB1 and NB2" presentations do distort greatly, especially when you are receiving strong signals on the band with the weak ones. I think the NB7's are much superior to the others I have on hand.
>
> Now, noise reduction (labeled NR or DSP on modern receivers) is a very different animal, but these also distort at least the background so they are not clear like the NB7 on the same noise.

Jim,

Do you happen to have a schematic for the Clearspeech? I bought one some time back that does not work. Heil never made that info avialable and then reviews said that someone else makes it now but neither let the schematic out.

I had also thought about the BHI as I think QST had some article 2 or 3 years ago that used the module in something else but again even that module was not cheap.

Thank you.

Hello Bernie.

I did not see a reply to you so I will start the ball rolling. My suggestion would be to acquire a Drake R4 (any) although the R4B would be the best choice as you did not need other filters. The SPR4 would also be an alternative since it was supposed to be the solid state equivalent of the R4A, B, and C. You would need to either get an FS4 or get several various band crystals for the various shortwave bands you want to listen to or get the FS4 or one of the DDS generators with amplifier to simulate the FS4. I originally got my R4B because I loved to listen to shortwave broadcasts and also wanted a receiver that covered the weird frequencies that the mars program I am in uses and alwork as a ham band receiver.

Good luck with your quest.

Bernie -

I would suggest going for an R-4A rather than the R-4. Several improvements were made between the two.

The early R-4A (s/n <4000) is on my early A-Line CD and changed from a tube PTO to solid state. The late R-4 added a VR tube, but I don't know at what s/n. There were about 2000 each made of the R-4 and early R-4A, ~3000 of the late R-4A, and about 9000 of the R-4B. Each converted a few more stages from tube to transistor but even the Version 3 of the R-4B was still all tube through the RF, IF and AF Output. TheProduct Detector and AF Preamp stages are tube through the Early R-4A.

ALL are functionally identical, with an identical block diagram. Changes from the Late R-4A to the R-4B are primarily cosmetic and refinements..

I would also recommend the R4B over the other R4any..nothing to add but they have become expensive...the 11 tube version of the R4A is nearly the same as the R4B .. earlier R4A had 13 tubes... but there are variations even among the R4B units as well. Hard to find the correct schematic for the right R4B unit I had. A possible Drake sleeper is the SW-4A .. AM only, but I consider it a R4 (lite) .. looks just like an R4, same tube line up in the RF and IF sections...good sensitivity and 5kz crystal filter for AM making broadcast stations sound great. It has a bit more audio out than the R4's, has
3 watts versus 1.5 watts.

Either way, you wont lose any money on these radios, I've owned about 20 of them over the years.

I have a "...just-plain-Jane-type" R-4 receiver here that I bought several years ago, which I absolutely LOVE to use.

Don't let the fact that the heart of the PTO in the R-4 is a 6AU6 tube, & not solid-state, deter you from acquiring one: the antics of the "superior" solid-state PTO in my T-4X transmitter (all well-documented in the Reflector archives, I'm sure) practically drove me to drink a few years ago, until I re-built almost the entire "works" with new parts!

Thanks, Bill. That confirms two things at once. My QC tag showed a date of 3-1-65, so that matches, and the OB2 is in my rig too. Those things help. By the way, that was a good year, I graduated high school then, HI.

I don't see anything exotic or unobtanium in the NB-7 circuit diagram. There may even be an off-the-shelf solution for the IF transformers, but I suspect they would not be difficult to duplicate. Making an aftermarket NB-7 should be do-able, but I don't imagine it would be cheap.

I remember seeing an article years ago written by a fellow who adapted a Ten-Tec noise blanker option to an R-4C with good results. Maybe that would be another starting point.

Even then I have only seen them on ebay and they seem to go for a lot more money there than I am willing to pay. That is what prompted the question as I do not mind building something and actually prefer that option but I have not seen anything about building an NB7 or clone but have seen K8AC's version of the Aux7. It looked like just building an NB7 from scratch might be a bit hard with some parts no longer readily available and that was what prompted the question. I have one rig that has noise blankers in it and absolutely hate it because it distorts very badly but find that I do often need something since I get electric fence noise or steady buzz from some touch lamp or doorbell transformer or similar and neither of my TR7's have noise blankers. So I am on a quest to find something.

No, I don't, but it seems to me that the circuit wasn't all that complex. If the DSP IC is running, there is hope. Check for cracked or cold solder connections, power where it's supposed to be, clock oscillator running, the usual. Could be as simple as a bad speaker jack or switch, blown audio amp, etc.

Bernie -

I would suggest going for an R-4A rather than the R-4. Several
improvements were made between the two.

The early R-4A (s/n <4000) is on my early A-Line CD and changed from a
tube PTO to solid state. The late R-4 added a VR tube, but I don't
know at what s/n. There were about 2000 each made of the R-4 and
early R-4A, ~3000 of the late R-4A, and about 9000 of the R-4B. Each
converted a few more stages from tube to transistor but even the
Version 3 of the R-4B was still all tube through the RF, IF and AF
Output. TheProduct Detector and AF Preamp stages are tube through the
Early R-4A.

ALL are functionally identical, with an identical block diagram.
Changes from the Late R-4A to the R-4B are primarily cosmetic and
refinements..

The SPR4 would also be an alternative since it was supposed to be the solid state equivalent of the R4A, B, and C. You would need to either get an FS4 or get several various band crystals for the various shortwave bands you want to listen to or get the FS4 or one of the DDS generators with amplifier to simulate the FS4. I originally got my R4B because I loved to listen to shortwave broadcasts and also wanted a receiver that covered the weird frequencies that the mars program I am in uses and alwork as a ham band receiver.

Bill already won the lowest so far at s/n 616, Fernando. That may also explain so many shipping in such a short time in the spring of 1965 as Steve and I reported earlier. They may have been putting in the updates before shipping them

I have an original Drake R-4 manual with my s/n 678 radio that has a handwritten note that it was for s/n 0598, and on the back is a stamped note saying "IMPORTANT, This book does not show the OB2 voltage regulator and other circuit features incorporated in production models. An up to date book will be available soon and will be sent to you after the receipt of your registration card."

Again, I cannot prove that it was for s/n 0598, but that's what it says on the cover.

Just to add confusion to the mix...

I have two R-4's here. One is 0765 which I'll assume has the OB2 VR tube – can't see it as it is in a CA-1 stacking cabinet with the T-4X.

Much to my surprise, the 2nd R-4, serial # 0051, does have the OB2 VR tube making it a 14 tube rx, with the OB2 mounted on the add-on piece in a cut-out square on the chassis. And a fine working receiver it is!

Drake must have added that VR tube pretty early in the line-up!

13386. General Coverage Receiver

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-25 04:32:59 UTC
From: John Sehring
Topic: 13302 Message: 13386

I'm not sure I totally like *any* of the R-4_ line for HF broadcast listening. I've had many from R-4 to late R-4B.

The problem is pinched audio quality from the diode envelope AM detector.

It is better with the R-4 and R-4A (13 tuber). With R-4B (don't know which exact version it is), the low end audio is simply rolled off to much. So much audio is missing, it sounds as the transmitting station is running quite low modulation levels.

No, I'm not looking for a lot of bass, down to about 250 Hz would be just fine, thank you. Maybe just the AF cap that delivers audio from only the AM detector needs trimming. I find the SSB AF frequency spot on.

In find the R-4A (13 t) & R-4 have better audio quality.

Two reasons...better product detector (the SS prod det circuit in the R-4B has problems with BFO leakage and distortion on modulation peaks--Bob Sherwood's web site on that)...two the audio stages are not tip top designs.

I feel that Drake did not have the handle on SS design but of course I find the tube stuff to be excellent.

For AM, I find the selectivity to be quite good in the 4.8 kHz bandwidth. But don't forget to bring the passband tuning to either hard left (9 o'clock) or hard right (3 o'clock) for best bandpass shape.

Using my crystal for 160 m coverage, I can swing down into the broadcast band where I can sometimes hear between-10 kHz-channel AM broadcast signals for elsewhere than N.A.

Another problem is the noise blanker, which I find excellent for pulse elimination in SSB/CW, does nada for AM signals. An automatic (its action modulated by AGC) noise limiter would be lovely but that's never going to happen, RIP.

You could get around that a little bit by using the "fast" agc but of course the R-4* switching won't let you do that!!!

I too have used the Timewave 59+ since its inception with my R-4*'s. Its AF selectivity, automatic multi-notch filter, and noise reduction is amazing to me even in the days of SDR radios.

Thanks Steve...

I had one of the very first R-4s, and I'm pretty sure it didNOT have
the VR tube in it. I'm guessing it didn't take very long in the field
before new owners started complaining about the stability. The first
'Preliminary' schematic that was shipped with the manual stating that
a 'Final' schematic would be out 'soon' did not show the VR tube. So
far we're down to s/n 270 WITH the VR, so if any escaped the factory
without it remains to be seen!

Anybody got an R-4 WITHOUT the VR tube??

Which is why I recommend something in the R8 family. My R8 is still going strong after 20 years. It's a joy to listen to for hours at a time.

Tim -

There were two versions each of the R-4, two versions ofthe Early
R-4A, Two versions of the Late R-4A andthree versions of the R-4B.
All versions are on the appropriate Service supplement CDs.

From: Paul Christensen
Topic: 13302 Message: 13393

Garey,

Probably a design "carry-over" from the 1A and early 2 series? The 1A has no VR, but it's easy to add and hide a 105V Zener to allow for better VFO regulation with line voltage changes. A series resistor is already part of the circuit that can be used as the Zener current limiter. Of course, no PTO in the 1A but even without the Zener, stability is very good.

I would need to go back and verify, but I don't believe the Collins 70K2 as used in the S/Line uses a VR. Stability is superb, but Collins did cheat a bit by limiting the PTO range to only 200 kHz segments. That added to the S/Line production cost since additional heterodyne crystals were needed as well as more switch contact positions.

Paul, W9AC

Thanks Steve...

I had one of the very first R-4s, and I'm pretty sure it didNOT have
the VR tube in it. I'm guessing it didn't take very long in the field
before new owners started complaining about the stability. The first
'Preliminary' schematic that was shipped with the manual stating that
a 'Final' schematic would be out 'soon' did not show the VR tube. So
far we're down to s/n 270 WITH the VR, so if any escaped the factory
without it remains to be seen!

Anybody got an R-4 WITHOUT the VR tube??

Actually, we are down to s/n # 0051 WITH the VR tube.

I suppose it is possible that Drake modified the radio, adding the OB2, after initial sale. It’s definitely not home-brewed. They would do stuff like that – I have a 26xxx TR-4 here with a factory installed front panel switched CW filter as an example.

Date: 2013-04-25 14:27:42 UTC
From: Garey Barrell
Topic: 13302 Message: 13395

John -

Excellent points. The audio in all of the R-4(any) is definitely tailored for SSB. Many SSB signals of the day had poor Carrier and 'rumble' suppression, including the T-4X, due to wider skirts of the typical 4 pole filters used. So most receivers and transmitter AF stages tended to roll off the bottom 3-400 Hz. A larger coupling cap was used in later versions, after the Early 'A'.

I wonder about your R-4B experience, as coupling capacitors were made considerably larger than those in the Late 'A'. The 0.1 uF, 12V ceramic caps are not the most reliable. Perhaps it's that 'tube' sound! :-) The audio stages in all are Class A, so any 'shaping' accomplished is via coupling and bypass caps. There is some negative feedback in a few stages.

The dual diode PD in the later versions is prone to BFO leakage, and this is improved considerably by replacing the 1N270 Germanium diodes with better matched Schottky diodes. They also handle audio peaks better. What could be better than a diode with a cat-whisker in it!?!? :-)

The Noise Blanker works on AM, but it is masked by the Slow AVC. If you have noise spikes of greater amplitude than the signal, the S-Meter will 'peak detect' it and display an average level. IF the noise is the very short, high amplitude spikes intended to be suppressed by this type of blanker, it will 'punch' holes. However the 'average' signal level is still high because of the carrier, so the S-Meter doesn't drop as dramatically as it does with SSB. Checking the efficacy ofthe NB is easily done by connected a piece of wire to the antenna input, and dragging the other end along a grounded metal surface. The S-Meter drop is dramatic because you're looking at a very low average power.

All are part of the 'Drake experience'! :-) Most all of these 'shortcomings' can be 'cured' by replacing the Drake with a shiny new Yaecomwood cable boxfor $4-5k. But that kind of defeats the purpose, doesn't it!!!?!?! :-)

Ed -

I think the best source is auto sound stores. MANY 'door' speakers
are 5 x 7, andmost all are 4 ohm. I would suggest making a tracing of
the outline and mounting holes of the original speaker, and take that
toan auto sound shop to check for fit. They are typically concerned
about depth, which doesn't concern us.

The BOSS line looks to be a good place to start, Amazon has a 'likely
suspect' for $12. It's model BRS5768. If I needed one, that's what I'd
buy, just to see! :-)

The 2-A and 2-B never had VR tubes either. I suspect the PTO was more
sensitive to voltage change than the earlier VFO's. Hard to believe! :-)

Another factor was with the 1 kHz calibration markings, people were
more critical of a little drift.

> Probably a design "carry-over" from the 1A and early 2 series? The 1A has no VR, but it's easy to add and hide a 105V Zener to allow for better VFO regulation with line voltage changes. A series resistor is already part of the circuit that can be used as the Zener current limiter. Of course, no PTO in the 1A but even without the Zener, stability is very good.
>
> I would need to go back and verify, but I don't believe the Collins 70K2 as used in the S/Line uses a VR. Stability is superb, but Collins did cheat a bit by limiting the PTO range to only 200 kHz segments. That added to the S/Line production cost since additional heterodyne crystals were needed as well as more switch contact positions.

to acquire a Drake R4 (any) although the R4B would be the best choice as you did not need
other filters. The SPR4 would also be an alternative since it was supposed to be the solid
state equivalent of the R4A, B, and C. You would need to either get an FS4 or get several
various band crystals for the various shortwave bands you want to listen to or get the FS4
or one of the DDS generators with amplifier to simulate the FS4. I originally got my R4B
because I loved to listen to shortwave broadcasts and also wanted a receiver that covered
the weird frequencies that the mars program I am in uses and alwork as a ham band receiver.

13400. Re: [DrakeRadio] MS4 Replacement Speaker

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-25 16:26:29 UTC
From: Paul Kraemer
Topic: 13302 Message: 13400

So that is the reason!
I have always gotten great merchandise from Parts Express, no regrets, and with a liberal 45 day return policy hard to beat.
Never thought to check what the Amazon price would be.
I have that 5x7 speaker and a couple round ones on my next order wish list just to check them with my ears.
Of course, I have realized more and more lately that issues like what is the best microphone, speaker, paint color, pizza and coffee do not have a correct answer because they are very subjective and depends totally on the individuals sensors.
I have somewhat refined sensors (cause I said so) but YMMV

Hi Garey et al,

As promised here yesterday, the serial number of my just-plain-jane R-4 receiver here is 0769...

...And YES, it DOES have the voltage regulator tube incorporated in it by the factory.

From: Richard Knoppow
Topic: 13302 Message: 13404

Regarding the noise suppressor: I think its main
advantage is in preventing noise pulses from actuating the
AVC and desensitizing the receiver. In older receivers
using noise clippers following the detector the audibility
of noise might be considerably reduced but its effect on the
AVC was nil. The blanker operates on the signal before it
gets to the AVC detector so the relative signal at the AVC
is not increased so much. Since the diode detector used for
conventional AVC are peak detectors the AVC level can be
quite considerably increased by short duty cycle pulses such
as ignition noise. The blanker works quite well on these
but does nothing for power line and similar noise.
I verified the noise blanker in my R4B was working by
setting up a pulse generator in the form of a bug key with
about a 4 Henry choke in series with three 9V batteries.
This makes very strong ignition noise type pulses. They
could still be heard with the noise blanker on but the
S-meter read more than 20 db lower than with it off. I did
not test with a carrier present but can do so to get a
closer approximation to normal receiving conditions. On the
usual noise from power lines, bad streetlamps, CF lamps,
etc., one can not tell if the NB is on or off, it does
nothing.

Richard -

Did you try my 'antenna lead dragged on a grounded surface' method??
People go through all sorts of machinations to generates short pulses,
and I'm beginning to wonder if MY receivers are the ONLY ones that
work this way?? I check the NB on every receiver I work on using this
method, and have found only one (TR-4) that needed to be adjusted.

Garey
It's not the clearance , it's the strength of the magnet . I went through that with a hallicrafter . the magnet pulled the supply out of my hands and it was not easy to get it away from the speaker . could not get a good hold on the supply . very little room to work with .

.....But I thought that we "enthusiasts" of Vacuum Tube radios, would enjoy this video, from Western Electric. Pretty nice video presentation, on how vacuum tubes are made. I would have liked it to be a bit more detailed. But, then, it probably wouldn't have been as popular of a show, back when it was produced, had it been much more detailed, than it is. For those who like to reminisce, about these things, enjoy!!!

I did, using a rough file and small screwdrive. It does work and proved to me that the blanker was not defective, however the method I tried generates a nice spark pulse that sounds much like auto ignition noise and it makes the operation of the blanker very evident. Unfortunately, most of the noise here is power line arcing type noise and nothing is very effective against it.

13414. Re: [DrakeRadio] General Coverage Receiver

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-26 06:19:21 UTC
From: Jim Wiley
Topic: 13302 Message: 13414

There is another way to simulate pulse type noise, particularly "woodpecker" noise, that works well for testing a noise blanker. What I do is insert a swept signal that runs from zero to 110 MHz at a rate that is adjustable from slow (about once a second) to rapid (100 Hz or so). The signal sweeps through the receiver passband so rapidly that it appears as a pulse. Because it is precisely repeatable, and adjustable in signal level from barely there to overwhelmingly loud, this technique makes it easy to optimize a noise blanker. However, there is a caveat - no single noise source can simulate all types of noise. For most applications, however, this method works for me. As always, YMMV. The sweeper I use is an old -hp- 8601A, but pretty much anything that will cover the frequency range should work. I have occasionally seen one of these sweepers at a flea market for $20 or so. Mine was free for the taking - the guy that had it didn't understand all the different ways it could be used.

Hi Garey,

Yes, been messin' with Drake -4-Line stuff since around 1985. Those Twins are what got me back on the air on HF.

I will carefully follow up your observations about the R-4A (13-tube) and the R-4B.

Your notes & responses are a treasure trove for me. I'm always keenly interested in the "march of mods" in radios & trying to keep up on them. Your CD's certainly have helped a lot on Drakes.

But it does drive a bit batty when those changes are not at all or correctly documented. I spent a few years in the military electronics/avionics game and EVERY change HAD to be on paper. "Configuration control" they called it. Woe unto those who didn't abide!

I don't know offhand who of the classique radio makers did better at that. Some mfrs. showed remarkable stability of circuit design. Hallicrafters comes to mind. And some didn't!

Hallicrafters did play some of the Detroit game of "skin it with some newer sheet metal and call it `completely new'!" E.g. SX-100 -> SX-122.

I don't know if such design stability showed:

A) Very good design, didn't need a bunch of changes, or

B) Stuff was considered just good enough, not too many complaints, and they're still sellin'!

Even the great demi-god Art Collins certainly made enuf changes in, say, the S-Line over the years. I have quite a stack o' papered stuff on that.

As far as buying/using YaeIcoWood radios, I don't have any of them here. Personal rule: I want to be able to fix/service all pieces of gear in my ham shack.

But it does drive a bit batty when those changes are not at all or correctly documented. I spent a few years in the military electronics/avionics game and EVERY change HAD to be on paper. "Configuration control" they called it. Woe unto those who didn't abide!

I don't know offhand who of the classique radio makers did better at that. Some mfrs. showed remarkable stability of circuit design. Hallicrafters comes to mind. And some didn't!

Hallicrafters did play some of the Detroit game of "skin it with some newer sheet metal and call it `completely new'!" E.g. SX-100 -> SX-122.

I don't know if such design stability showed:

A) Very good design, didn't need a bunch of changes, or

B) Stuff was considered just good enough, not too many complaints, and they're still sellin'!

Even the great demi-god Art Collins certainly made enuf changes in, say, the S-Line over the years. I have quite a stack o' papered stuff on that.

As far as buying/using YaeIcoWood radios, I don't have any of them here. Personal rule: I want to be able to fix/service all pieces of gear in my ham shack.

--John Sehring VE6EQR-WB0EQ nr Calgary, Alberta, Canada

The government was a big enough customer to make
demands on suppliers and make them stick. Variations in
designs are common and Hallicrafters was notorious for them.
Some of this came from the exigencies of the market; one
could not spend forever on refining a design so sometimes
quite large things fell through the cracks. Even the very
thoroughly engineered R-390 was rapidly redesigned and
become the R-390A, not because it didn't work well but
because it was difficult to maintain and some features were
found to be unnecessary or to cause more trouble than they
were worth. As an example the voltage regulating method
which generated a tremendous amount of heat.
Consumer gear is somewhat different; the design being
determined largely by what the manufacturer sees as the
market forces. When something is made in sufficient
quantity more effort can be put into refining it before
production but things are still missed, for instance
Toyota's recent problems.
U.S. military handbooks, at least Signal Corps
handbooks, had a correction sheet in the back, usually with
a picture of Connie Rod, asking for corrections or suggested
changes.
Drake seems to have done very well at making equipment
which was well designed for function and was producible. I
have 4B twins which at least meet their original specs and
are generally well made. Drake used a different construction
philosophy than Collins; much lighter and with component
arrangements made primarily for function (almost zero lead
length on some parts, etc) which make it more difficult to
work on in some ways, yet its very reliable and still works
like new after some forty plus years.
Of course, Drake was not a newcomer to the business
when they began to make ham radio equipment, they had made
industrial and military equipment in the past so did not
have to guess at some things.

This and a number of other radio related movies are
available at http://www.archive.org including one at the
RCA tube factory. Its pretty murky but shows the hand
assembly of tube elements and large rotating sealing
machines with flames going all over the place. All the stuff
at Archive.org can be downloaded.

13421. (no subject)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-26 17:27:43 UTC
From: John Sehring
Topic: 13421 Message: 13421

I consider the only two lines of SSB tube-type radios suitable (in stock form) for use on today's HF bands, the Drake Twins (preferrably the ones with the FET PTO, or having one transplanted in) and the Collins S-Line (I think the KWM-2 fits here, too).

I think the primary issue is frequency stability. As the Drake Twins PTO runs around 5 MHz, it's very easy to beat them against WWV 5 MHz. Then use a stable AF oscillator or frequency counter to monitor the beat note between 'em = the drift Take notes & plot them when done.

The later Drake FET PTO, as found in the R-4B for example (Garey: are there variations of this FET PTO, too? If so, which are more stable?) is clearly better than the bi-polar ones. The only plain R-4 (with tube-type PTO) I tested was good for tube type PTO's but nothing to write home about.

Yes, as someone pointed out, Collins cheated quite a bit by having only 200 kHz PTO coverage. I think that gets damn annoying on the wider ham bands. I haven't used my S-Line in so long that I just don't recall its stability.

So to list *relative* pros/cons of the receivers, Collins has much superior selectivity due to mechanical filter. But does not have a noise blanker, passband tuning is clumsily accomplished using a variable frequency BFO (unlike the elegance of 75A* design or the Drakes), has 200 kHz (vs. 500 kHz of Drakes) PTO range, mechanical filter does have quite a bit of ringing (transient response is not so hot) with transients & pulses. In side by sides, the Drake R-4A gives better copy than the 75S-3 under, say, thunderstorm QRN, as the former's bandpass shape is smoother and so rings less.

Drakes have provision for 10 more bands of HF coverage; only a few of the S-Line rx's had the 14-extra bands of frequency coverage capability, the 75S-3C. However, neither can run on the 60m band (coverage gap).

Both have superb AGC

Last but not least, the S-Line's CW mode is a kluge, clearly an afterthought. Mods abound for "improving" it. Drake does proper CW! However, the S-Line was not really a totally ham radio design, but for military & commercial use, so CW not vital.

On tx side, I like 6146's better than sweepers like 6JB6's. S-Line has very sophisticated ALC system, is driven by output tube RF envelope detection, not just grid current draw as the Drakes.

Both radios of course had a notch filter.

John -

I have about 20 years on you on the 4 Line. I go back to the 1-A in 1957.!

Yes, Drake was not the best when it came to field changes. The production changes are fairly well documented by serial number, but even they are not 'perfect'. Unfortunately, those docs cost money, and unless you sell to the gummint, people generally don't care. I just wish I had done my CDs 30 years ago! Would have added years to my life that I lost tracing circuits from one little board to another through those harnesses! Making the CDs has helped me a lot, and I have been able to document changes in a few pieces that were NEVER documented by Drake.

I worked for NASA, and if you changed a soldering iron tip it had to be logged!! :-) Manned flight was the most critical, of course, and was tightly traced and logged fromwhen the silicon and gold were mined, to the transistor and the board it plugged into, all the way up to it's 'final destination'. But it costs money and slows you down considerably. However, when something did go wrong, you could follow the failure all the way back to find out where it went off the rails.

Collins was probably one of the best 'commercial' vendors, at least they documented their changes. The majority of their business was with the government so it was demanded. But it DOES cost money.

As with most things, it's all a matter of trade-offs. Hallicrafter's had some first rate engineers, and some of their circuits were groundbreaking. Unfortunately they did not devote the same amount of effort/$ to components. They essentially used cheap, standard components developed for kitchen radios, and the cheapest mechanical structure that would hold together.

National and Hammarlund manufactured many of their own parts, and held to a considerably higher standard than Halli.

Collins had first rate engineers and 'price is no object' government contracts, and so went with highquality at every opportunity.

Drake came along with excellent and creative engineering, and used a less expensive mechanical approach. Things were bent and assembled rather than machined out of a block. Compare the Collins PTO to the Drake PTO for an excellent example. If I was going to drop it out of a plane, dragit through the mud and/or drive a tank over it, I'd want the Collins. If it's going to sit on a desk in an air conditioned house, the Drake is more than adequate!! I don't think Bob Drake felt

like a patterned material needed to be glued to the front panel of a
radio......

My newest radios are the Kenwood TS-940 (1986) and Drake R-8A (1997).
The Kenwood is repairable by me, but the R-8 is 'iffy'. I think I
could handle it if I could get the parts.

John -

I've documented at least 17 varieties of PTOs, but most variances are the result of device changes to 'newer' types, and power supply decoupling.

The FET PTO first appeared in the Version 2 of the R-4B, s/n 8000. The first 1000 units (7000-7999) used the bipolar PTO. The T-4XB had the bipolar PTO (about 13750, 10/67) and was 'documented' as FET at (16159, 8/69).

The klugey CW was only in the 32S-1. CW was generated by feeding an audio tone to the Mic input with resultant 'extra' signals. The 32S-3 bypassed the Bal Modulator and the filter to the 1st Mixer for CW.

The comparison of the 6146 to the 6JB6 has gone through several iterations over the years. A 'new' 6146 costs just about the same today as a 6JB6. Granted, you can still find used or pull 6146s for less, and thanks to their lower perveance they're more likely to have 'some' life left. The 6JB6 is considerably higher perveance, (ability to draw LARGE currents at relatively low Plate voltages,) one of the main reasons they were chosen, also gives them a much greater ability to melt themselves when run off-resonance or to a mismatched load. Taking care to avoid those two conditions will allow 6JB6s to last just as long as 6146s. I have 15 year old 6JB6s that have had heavy use, and still have full output. A pair of 6146s in a T-4X will do good to put out 100 W, compared to the 140-150W from a pair of 6JB6s. Considering the 'horsepower' race that was underway in the 60's, it's not difficult to see why the 6JB6 was chosen. The 6JB6 cost about $2.80 at retail, I believe $7 for a matched pair from Drake. The 6146 cost about $5, so not a bug cost saving.

Yes, the Collins ALC is 'better' on paper, and works very well. However, I doubt seriously that someone could tell the difference between it and the Grid current sensing of the T-4X by listening to the signal. A two-tone test on the T-4X shows a nice clean waveform, and only very slight flat-topping as the Grid 'runs out of room.'

John Sehring wrote:
> The later Drake FET PTO, as found in the R-4B for example (Garey: are there variations of

this FET PTO, too? If so, which are more stable?) is clearly better than the bi-polar ones. The only plain R-4 (with tube-type PTO) I tested was good for tube type PTO's but nothing to write home about.
>
> Last but not least, the S-Line's CW mode is a kluge, clearly an afterthought. Mods abound for "improving" it. Drake does proper CW! However, the S-Line was not really a totally ham radio design, but for military & commercial use, so CW not vital.
>
> On tx side, I like 6146's better than sweepers like 6JB6's. S-Line has very sophisticated ALC system, is driven by output tube RF envelope detection, not just grid current draw as the Drakes.

OK, Richard -- I went through the Army's electronics and radar training school at Redstone Arsenal Alabama in 1967-68, spent a few years in general support for the Army's Hawk system (predecessor of the Patriot), and saw a lot of manuals -- but I don't know who/what "Connie Rod" is/was. Maybe he/she was unique to the Signal Corps?

Just FYI:

About the last 10 years of P.S. Magazine, the Preventive Maintenance Monthly, is available from Logsa:

https://www.logsa.army.mil/psmag/archive2013.cfm

About the first 10 years (from the '40's through the '50's) is available from the Digital Comics Museum (a British website) here:

http://digitalcomicmuseum.com/index.php?ACT=dosearch

You can download pdf copies from the Logsa site and read them on the Digital Comics site. To download from the Digital Comics site, you have to register, which is free and obligation free.

They don't have much Drake info, but do occasionally have military radio info.

Growing up in the Army in the '50's, these magazines were like comic books to me.

From: Steve Wedge
Topic: 13429 Message: 13429

I was reassembling an R-4A that had undergone the strip-sink-oven treatment and apparently, I've gotten way too used to R-4B's.

I switched the 0B2 and 6EH5 and, unfortunately, fired it up! Heard crackling and cut it off IMMEDIATELY!

I immediately saw my transgression (it wasn't hard: the 0B2 was glowing like Chernobyl!) and swapped the tubes. Re-powered and - miracle or miracles - the receiver was working fine!

Yeah - I have to replace the plate resistor for the audio output: it's got a nice swollen part in the middle but still measures 325 ohms.

Word to the wise. There are TWO tall, 7-pin tubes in an R-4A!

Yeah, you lucked out..... Nominal Zener dissipation is about 0.2W.
Leaving out the 0B2 only doubles it to 0.4W, and it's a 0.5W Zener.

Better lucky than good!! :-) Lucky you didn't take out the output
transformer.

When all else fails..... RTFM! :-)

13433. 6JB6

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-27 14:30:01 UTC
From: John Sehring
Topic: 5203 Message: 13433

Yes, and high perveance tube allows relaxed B+ voltage requirements, too. Lower B+ all around = less expensive circuit (lower voltage ratings needed on components) & more reliability, too. Another sign of that is use of 6EH5 in audio output, rather than, say, a 6AQ5. Collins S-Line used 6BF5 there, betcha it's a low perveance too..

I too have 6JB6s from decades ago, not abused, still give decent output. It's all about care & feeding of 'em.

--John Sehring VE6EQR-WB0EQ nr Calgary, Alberta, Canada

The comparison of the 6146 to the 6JB6 has gone through several iterations over the years. A 'new' 6146 costs just about the same today as a 6JB6. Granted, you can still find used or pull 6146s for less, and thanks to their lower perveance they're more likely to have 'some' life left. The 6JB6 is considerably higher perveance, (ability to draw LARGE currents at relatively low Plate voltages,) one of the main reasons they were chosen, also gives them a much greater ability to melt themselves when run off-resonance or to a mismatched load.

Hi,

My 2nd TR-7 is on ebay for a few more days but if it doesn't sell,
I've got a wild hare to have an R-7 (or R-8) to work with the
TR-7 I'm keeping. I'm thinking of trying to trade my 2nd
TR-7 for or towards a nice R-7 or R-8 RX. See my description
in my post asking what it's worth from a few days ago.

On a related subject. It's not really clear to me from the
manual but is it possible to share the same antenna between a TR-7
and an another RX without an external TR/RX relay?

Let me know if any of you are interested in such a trade?

Thanks,

Jon

Welcome to Dayton,
Just search Dayton Hamvention 2013
Drake Forum schedule (under affiliated events) is on line but in any case
Sat.10:30 AM Room 2.

It really helps if you go online and have some idea of what the layouts
are. The layout will be printed in the Hamvention brochure which you should
obtain when you go into the main entrances.
Have fun. Carl wd8nhk

It's needed only for the INJ cable through the B Line. 3' long! You
need two of these for the INJ and the CAR OSC for the C-Line, total of
six feet....

It would be great if ONE person could buy the 250' and we'd never need
any more for the list! :-)

Hey, Garey -

There has been a lot of discussion over the past several years about where to get and how to make these injection cables - mine are original and seem to be holding up well - do these things deteriorate with time? If so, how often should you replace them? If they deteriorate, is it from physical damage, or from changing impedance or other electrical problems?

Subject: Re: [DrakeRadio] Belden 8421 cable 250 feet on Ebay

It's needed only for the INJ cable through the B Line. 3' long! You
need two of these for the INJ and the CAR OSC for the C-Line, total of
six feet....

It would be great if ONE person could buy the 250' and we'd never need
any more for the list! :-)

From: Garey Barrell
Topic: 13432 Message: 13442

Hi Terry -

They seem to get stiff after many years, I guess all the plasticizer leaches out of the jacket. I don't know if it migrates into the internal poly insulator like coax, or if it just goes into the atmosphere..... YIKES! nobody tell the EPA...

I've used the stiff ones because they were the right shape, and have never noticed a degradation. I always touch up the INJ tuning with the units cabled together, and that seems to give the least variation in RF TUNE and PRESELECTOR when switching from RCVR to XMTR control.

I guess it could get to the point where the outer jacket cracks, perhaps letting moisture in, but I've not seen any that bad. All the rest of the cables are just audio grade, and unless the wire breaks or someone steps on a connector they don't go bad.

While I've never felt the need to replacean INJ, I've made new ones, and it certainly can't hurt as long as you're using 8421. Some insiston RG-62 which is bulky, difficult to work with and prone to shorting if bent too sharply. RG-59 'will work', but it's bulky as well. Neither is much of a problem, but I like to set up the twins with the speaker between them and thefatter cables have to be considerably longer to avoid sharp bends.

>On a related subject. It's not really clear to me from the
>manual but is it possible to share the same antenna between a TR-7
>and an another RX without an external TR/RX relay?

Yes, the R-7 does just that via the RX antenna loop connectors on the rear panel of the TR-7. The R-7 has an antenna splitter built in to allow operation of both receivers from the same antenna (with a 3 dB penalty for splitting the signal). In theory, you could use this loop with any receiver, and incorporate your own splitter and even a preamp if desired. My future plans include putting a vintage Ameco tube preamp/preselector, which has it's own auxiliary receiver output, in the loop between the TR-7 and R-7.

The only drawback of this method (other than the 3 dB penalty) is that the Receive antenna line is pulled out of the TR-7 after the low pass filter, so signals higher in frequency than the bandwitch segment selected on the TR-7 will be attenuated.

13444. High perveance tubes - 6JB6

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-27 21:39:23 UTC
From: John Sehring
Topic: 13444 Message: 13444

Perhaps I wasn't clear...

Being able to run a radio at lower B+ voltage (by use of high perveance tubes) can reduce voltage stress all around on insulation systems and passive components, for example. Can translate into longer life.

Collins did same with KWM-2 & S-Line.

And no, sweep tubes wouldn't necessary last longer. And yes, tune up needs to be fast to avoid cookin' 'em.

I think TV (tube-type) mfrs asked for this from tube mfrs for same reason.

Sweep tubes in TVs take a terrible beating! I recall my uncle had a very early DuMont TV, believe it used 807's in sweep section!

>John,
>
>
>Not sure I totally agree with your comments about lower voltage 6JB6 equates with higher reliability. The tubes are intolerant of excessive current except for a few seconds and heat up quite quickly. That is part of the reason that their input/output is so much lower on AM than SSB. Tuning the final tank circuit on a B or C line has to be done very quickly; a chart of settings for each band helps. But there are a lot of newbies out there that don't comprehend what "dipping the finals" is all about. After replacing a set of finals the lesson is often learned, hi hi. So in theory, the tubes might last longer than their higher voltage counterparts but, functionally, in practice, that depends on user awareness of proper operation.

>Yes, and high perveance tube allows relaxed B+ voltage requirements, too. Lower B+ all around = less expensive circuit (lower voltage ratings needed on components) & more reliability, too. Another sign of that is use of 6EH5 in audio output, rather than, say, a 6AQ5. Collins S-Line used 6BF5 there, betcha it's a low perveance too..
>
>I too have 6JB6s from decades ago, not abused, still give decent output. It's all about care & feeding of 'em.

I did and so far have 190 ft left
I did not get it that cheap but considering the investment I think my
selling price for 50 cents a foot plus postage is pretty generous, put in
box, take to post office.
ny takers?
Buy a AC-4 rebuild kit and I'll include 6 ft for FREE. Today only

13452. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-28 18:23:31 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 13452

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

13453. Recapping Service

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: Steve Wedge
Topic: 13453 Message: 13453

Just thought I'd drop a note in as I finish up an alignment: I will re-cap your R-4x receiver for a flat rate plus shipping. I use Hayseed Hamfest parts and check out the rig's performance after installation. This replaces ALL electrolytic capacitors in the rig.

I'll also rebuild your AC-4 or re-cap T-4any and TR-4any.

Contact me off-list for particulars...

73,

Steve Wedge, W1ES/4

13454. Trade: B twins for C-4 console / Power Master

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-29 00:05:56 UTC
From: vacuuminded2@...

I am looking for a nice condition Drake C-4 console, very preferably with the Power Master accessory and antenna switch control. I have available for haggling, a very nice pair of B line twins. This would include R-4B, T-4XB, and AC-4 installed in the MS-4 speaker cabinet. Completely stock, worked fine when placed on the shelf a couple years ago but I can go through them and align if requested/necessary. Cosmetics are a conservative 8.5 out of 10, (I'm picky), I will gladly take pictures for anybody with serious interest looking to trade.

13456. Issue Tuning a T-4xc

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-29 02:18:53 UTC
From: kf5str
Topic: 13456 Message: 13456

Hello -

I recently acquired a T-4XC / R-4B station and seem to be having a problem getting the transmitter tuned. This
is my first tube set and have no prior experience with them. Im having trouble getting past step b from the owner's manual
where I'm trying to dip the plate current. The instructions say to advance the gain to 12 o'clock, then adjust the
plate control for a plate current dip. Problem is Im not seeing the dip. Is there something missing or that Im supposed to
be doing that is not covered in the manual?

Thanks!

From: Garey Barrell
Topic: 13456 Message: 13457

Have you set the idle biasper Section 3-3 of the manual? That must be done first. Then be certain that you have a dummy load (preferable) or a known resonant antenna for the frequency in use, along with a wattmeter or other type of output indicator.

Go to Section 3-4, and preset all the controls as described. THEN _readthrough the entire Section 3-6_to be sure you understand what you are going to do. The PA tubes in the T-4XC are very easily destroyed by improper _or SLOW_ tuning. They're also expensive!

Do Section 3-6, para A exactly as described. If the transmitter does not react exactly as described in any way, switch back toSSB immediately and figure out why. Check dummy load, coax, or antenna and if ok then try again. If still no luck, you may need some help to determine what is wrong.

IF you are able to dip the PLATE current, but see no output when you push in on the LOADcontrol, you may have a fault in the transmitter. Check for output with an external wattmeter or SWR meter.

Again, I can't stress enoughthat expensive damage can be done in under a minute if something is not right. ANY time you do not get a DIP in plate current when adjusting the PLATE control, something is wrong.

If yes, is it a C6? and if yes again, do you have a ham radio mounted in it.

I am looking for information pertaining to an antenna mounting plate that goes behind the license plate and I have questions about how you ran a ground plane.

Thank you

Joe Wolfe - W7RKN

I don't know which version of the manual you have but
the one in my files, probably from BAMA, is quite strangely
organized. I first getting an on-line manual for the T4XB
which is a little better organized. The two transmitters are
very similar. Second suggestion is to order Garrey Barrell's
CD on the C line and, since you have a B line receiver maybe
his B line disc too. They are not expensive and are IMO
absolute necessities if you want to get the best out of your
equipment.
You need a decent dummy load, have you one?
The procedure is as follows:
Connect a 50 ohm dummy load that can dissipate the
output of the transmitter.
Set the gain control at minimum and the load control at
minimum (completely counter-clockwise).
Set the Mode contol at SSB.
After a warm up of a few minutes set the bias according
to the instructions. When the sideband selector is in USB
and the gain control at minimum there will be no drive so
the plate current shown on the meter is the bias current.
The correct setting is 70 ma. If you can't get this value
there is a problem and you should shut down the transmitter
```

until you can make some measurements.
To tune start with the gain, plate tune and plate load all completely CCW.
Choose a band. The book suggests 80 meters and that will do. Set the RF tune at about the center of the 80 meter segment. Before doing this check that the slow motion pointer is not mis-aligned by turning the control fully counter-clockwise and looking at the position of the red pointer; it should be at the counter-clockwise end of the calibrated scale, i.e., the bottom of the 160 meter segment. If its not push it there with your finger, its a spring fit on the shaft of the tune adjustment.
Now, set the RF Tune to about the center of the 80 meter segment and set the main tuning control at about the middle of the 80 meter band, say 3700 Khz.
Now, put the function switch on TUNE. Very carefully raise the level of the GAIN control until you see some upward deflection of the plate meter, you want to get a level you can just see. When you have that keep your fingers on the GAIN control and move the RF TUNE control to peak the meter reading. As the plate current comes up keep it at a very low level by turning the gain back down. As quickly as you can set the RF Tune to a peak and then move the Plate Tune control clockwise until you get a dip. If you can't get a dip drop the gain back to zero quickly and shut the transmitter down. If you get a dip then bring the gain up and check the RF Tune to make sure its peaked. Then pull out the Plate Tune knob to switch the meter to RF Out and increase the loading to bring it up, then let the knob go back in and recheck the plate dip. Alternate between output power and plate current until you have the maximum power you can get. Always dip the plate current last. Now move the Gain control up and the power should increase. Now re-tune the Plate Load and Plate Tuning again. If you are loading into a resistive load and the amplifier is properly neutralized you should be able to see a peak in the _output_ at the same time as the plate current dips with tuning. Note that as you approach maximum loading there will be very little dip as you tune through resonance. The power should always peak at the current minimum.
This tuning process is very much simpler and faster than this description suggests. Once you have found the initial dip there will be little change as the loading is increased.
I find it very helpful to have an external power meter on the output. That allows me to see the relative action of the plate tuning and loading without having to switch.
I must reinforce Garrey's warning about running the amplifier out of tune for more than a couple of seconds. The tubes used in the Drake and many other transmitters of

the period have little margin for overload. It doesn't take much to ruin them. When that happens the power output is seriously reduced. If handled with care these tubes will last for many years.
Another suggestion: obtain a small fan to cool the final tubes. It does not have to move much air. I use a small 115V AC fan I got from All Electronics here in Los Angeles, they probably have them on-line. I put a couple of protective screens (Also from All) and used some stick on foam weatherstipping around the edges. The fan just lies on top of the cabinet over the final cage. It should blow out, that is _suck_ the hot air from over the tubes. That way it will also draw cool air over most of the chassis. I put a lamp switch in the line for mine. Simple but keeps the tubes and the whole transmitter cool.
Please let us know what progress you make with this.
The TR-4C and B are excellent little transmitters with specs as good as any current ricebox.

13464. Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-29 16:06:07 UTC
From: slowcountry1
Topic: 13108 Message: 13464

Garey,

Here is an update on the TR-4 progress;

Thanks to a local ham, KC9LAD, he checked rf at the different stages and everything seemed to be amplifying at the suspect tubes. After sitting a parts rig next to my TR-4, we found that a mica cap (don't remember which number it is) was placed on the wrong leg to T-9. After moving it to the correct leg, on cal 15M produces S-9 and 10M now produces about S-4. We went back through all of the alignment and everything was pretty close. Section E, adjustment of Injection Couplers had to be done without the alignment load on 10M. When using the alignment load the S-meter has no deflection and cannot determine proper calibration. Any ideas here?

Section G. Adjustment of Bal Modulator still does not produce and plate current above resting current.

All bands appear to have the appropriate sensitivity except for 10M. As stated in Cal mode it will produce an S-3 or S-4 reading. My TR-4CW with produce S-7. Is this just normal behavior for the TR-4 or am I still off somewhere?

Growing extremely tired of the low audio from the TR-4, I removed the TR-4 audio board from a TR-4Cw parts rig and installed it in the TR-4. I now have output audio consistent with my TR-4Cw. This was quite a chore obtaining sufficient lead lengths on a number of the cables.

Thank you for your time,

Doug N9XTF

> One of the first things I did was check the band oscillator. All of the voltages to TP were positive so I adjusted L1, L2 and L5; I was able to bring them down but only close to zero, could not obtain a negative voltage. I swapped out V1 with a used tube and got 40M to -.39VDC 15M to -.43VDC and 10M to -.42VDC. I did not have a new tube so today I replaced V1 with a new Amperex 6U8A tube that I had (I tried the tube from V3 it wasn't any better). I was then able to get 40M to -1.512VDC 15M to -1.482VDC and 10M to -1.34VDC. For smiles and grins, I replaced V3, assuming it was soft, with a new Amperex 6U8A tube. I have a bunch of these from a sale somewhere but I didn't have any 6EA8 new replacements.

15 and 10 are very quit on receive, volume has to be all the way up and strong signals are still faint.

Doug -

Whoops! Those pesky connections insist on being made to the correct pin..... :-) This is one of the places where the CD comes in very handy. See my first message at the bottom of thisstring!

I wouldn't worry about the Section G. problem. This methodof setting the BAL MOD was written for the early TR-4 with 4 pole filters (soupcan). The newer sixpole filters have sharper skirts, making the CAR OSC signal too far down to overcome idle current. Later BAL MOD adjustments need to be done with a scope or separate receiver and the adjustments made to minimize the carrier feedthrough. You should be able to null it almost to zero on the scope or well into the noise on a separate receiver.

Have you tried listening to a different harmonic of the CAL? The level can vary quite a bit up there from harmonic to harmonic.

I don't see your s/n here. Do you have a 12BA6, a 12BZ6 or a 6BZ6 at V11? Also, sub V7.

Yes, the audio preamp stage is a big help.

Progress, you're getting there.....

13466. Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-29 17:10:22 UTC
From: slowcountry1
Topic: 13108 Message: 13466

Garey,

Yes, I have used the CD to attempt to trace everything that I have found modified and screwed up by the previous golden screw driver. I was unable to see this clearly enough on the CD's, its in a tight spot. I make a hand drawing and take pictures before I change anything to ensure that I place parts back where they came from however; this one was already in the wrong place so it went back wrong, oops!

The serial number is 26095, from what I can tell, it more resembles a TR-3 than the pictures of the TR-4.

The rig had a 6BZ6 at V-11 when I started. The rig calls for a 12BZ6 so that's the first thing I replaced. V-7 is a 12BA6 which I've swapped out a couple of times. The stage that I'm at is tolerable however; my idea was to dedicated this rig to 10/15M service, so this is why i'm concerned with sensitivity on 10M. My TR-4CW with the NB will be dedicated to the lower bands and my TR-6 for 6M.

I have tried multiple harmonics of the calibrator signal; have not noticed anything any stronger from one to the other.

Also, as suggested on my tuning complaint earlier in the series of messages, I DeOxit the Plate and loading caps and replaced the ball bearing grease. The plate and load caps are very smooth now and tuning is much smoother however; the plate cap still produces somewhat of a jumpy response in the tuning process. I have checked the grounds on the air variables as well. Is this possibly a coupling capacitor?

I can not believe all of the foul connections and screwy modifications that I have run across on this one. I lost the filament voltage on two of the 6JB6s and the other 6volt tubes the other night. The filament voltage lead off the first PA tube was partially cut and I did not notice it and then it finally broke off. After I get the darn thing working 100%, I'm going to have to go back and re-dress / replace some coax, wire and such that have iron burns and such from previous owners to make it look halfway decent. Its such a great radio its a shame its had such a rough life.

13467. Re: [DrakeRadio] Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-29 17:36:26 UTC
From: Garey Barrell
Topic: 13108 Message: 13467

OK, I recall this one now. I typically have four or five of these 'projects' going at a time, and sometimes they run together! :-)

Did you verify that you have 12V on the 12BZ6??

Your erratic tuning sounds like neutralization. This wouldn't affect sensitivity on 10M though. Any time you have a stage or stages that are 'jittery' or jump around when tune, it's a good bet that you have a stability problem.

It 'could' indicate a fixed capacitor breaking down, or a bad solder joint. Mica caps with large DC voltagesappliedto them can sometimes develop 'whiskers' that can short intermittently. And of course, bad grounds, or poor lead dress can cause instability as well.

13468. Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: slowcountry1
Topic: 13108 Message: 13468

Garey,

Yes I verified the voltage early on, the 6BZ6 that was in there was very black from over voltage. I also verified that the leads were dressed properly and went to the correct locations. That's not to say that I didn't miss something though. I purchased a dozen 12BZ6 tubes and have tried several of them to make sure that I did not have a soft tube. They all act the same.

I neautralized the PA and it is very close on all bands. It was quite difficult to do this time, compared to my other drakes though.

> > Garey,
> >
> > Yes, I have used the CD to attempt to trace everything that I have found modified and screwed up by the previous golden screw driver. I was unable to see this clearly enough on the CD's, its in a tight spot. I make a hand drawing and take pictures before I change anything to ensure that I place parts back where they came from however; this one was already in the wrong place so it went back wrong, oops!
> >
> > The serial number is 26095, from what I can tell, it more resembles a TR-3 than the

pictures of the TR-4.
> >
> > The rig had a 6BZ6 at V-11 when I started. The rig calls for a 12BZ6 so that's the first thing I replaced. V-7 is a 12BA6 which I've swapped out a couple of times. The stage that I'm at is tolerable however; my idea was to dedicated this rig to 10/15M service, so this is why i'm concerned with sensitivity on 10M. My TR-4CW with the NB will be dedicated to the lower bands and my TR-6 for 6M.
> >
> > I have tried multiple harmonics of the calibrator signal; have not noticed anything any stronger from one to the other.
> >
> > Also, as suggested on my tuning complaint earlier in the series of messages, I DeOxit the Plate and loading caps and replaced the ball bearing grease. The plate and load caps are very smooth now and tuning is much smoother however; the plate cap still produces somewhat of a jumpy response in the tuning process. I have checked the grounds on the air variables as well. Is this possibly a coupling capacitor?
> >
> > I can not believe all of the foul connections and screwy modifications that I have run across on this one. I lost the filament voltage on two of the 6JB6s and the other 6volt tubes the other night. The filament voltage lead off the first PA tube was partially cut and I did not notice it and then it finally broke off. After I get the darn thing working 100%, I'm going to have to go back and re-dress / replace some coax, wire and such that have iron burns and such from previous owners to make it look halfway decent. Its such a great radio its a shame its had such a rough life.

13470. WTB: Drake 2BQ or 2AQ

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-29 19:05:59 UTC
From: Van Lincoln WD8AAM
Topic: 13470 Message: 13470

WANT TO BUY
WTB: Drake 2BQ or 2AQ, not working OK as long as all the pieces are there.
My 2B is lonely and I want to make her happy, and me also....LOL
Let me know if you have one to sell, thank you Van, wd8aam Minnesota

13471. TR-7 Station - What is it worth?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-29 17:59:01 UTC
From: bob_af6c
Topic: 13471 Message: 13471

Last August I was asked to sell some equipment for an elderly ham. Included in the list of equipment is a Drake TR-7 Station. Most of the equipment sold, but there were no serious offers on the TR-7. According to the owner, the radio was working when removed from service around 10 years ago, with the exception of an intermittent in the mic connector.

Earlier this month I decided I wanted to get the radio out of the garage and figured I needed to get it working. The mic connector was reinstalled, the radio fired up (after conditioning the capacitors in the PS-7) and put on the air on our club 10 meter net. Good reports were received and the radio seems to be working well. Power output into a dummy load is 140W (less on 15 and 10M).

Physically, with the exception of the microphone, the equipment is very good with no major scratches or dents. The photo on the website makes the plastic over the display look scratched, but that is more the result of the head-on flash than the actual plastic.

You can get the details of the radio at:

http://www.w6ze.org/FOR-SALE/W5KGM_Sale.html

Basically it includes the TR-7 (with DR7, NB7, FA7, 300 and 1800 Hz optional filters) PS-7, RV-7, Drake microphone, original manuals and the Service/Schematic manual).

I'd like to sell it locally (Northern Orange County, CA) I currently have a price of $699 for the station, but wonder if that is excessive or perhaps too low? That price point was suggested by someone else.

Bob - AF6C

From: Jim Shorney
Topic: 13471 Message: 13472

To set a fair price for the radio, you really need to know which options are intsalled:
Noise blanker
Optional filters
AUX-7
Fan

Here are a couple of references:

http://www.joetracker.com/prices/drake.htm

http://www.aade.com/hampedia/drakep.htm

Prices vary according to condition of the radio, options installed, accessories included, serial number (and if it is a real "A" model or not), and current demand.

Wayne -

That refers to the color coded CAR OSC crystal. This started in the
late A models and carried through the B. There is an article on
WB4HFN describing what this was for.

13475. Re: [DrakeRadio] T-4XB on eBay

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-30 01:50:37 UTC
From: Steve Wedge
Topic: 13473 Message: 13475

The letter suffixes denoted the characteristics of the carrier oscillator crystal. Back before the C-Line, when the rigs were synched by this oscillator, they tried to match the characteristics of this crystal as closely as possible. Thus, if you wanted to keep your Twins more able to transceive, you matched the letter codes so that you had similar drift characteristics.

I've seen "B", "G" and "R" units, and the CO crystals were dabbed in Blue, Green or Red paint, accordingly.

Garey may have the actual specs for the markings...

I am going to collect my TR4 RV4 AC4 in a couple of weeks.

What size are the cabinets? please.

Then I can make up the packing to fit.

A 2 hour drive and then a 5 hour coach trip to meet the seller, then guess what after an hour or so in new Plymouth and other 5 hour coach trip back to Auckland and a 2 hour drive home, I must be truly nuts :-)

Thanks

13480. Re: [DrakeRadio] Size of TR4 & RV4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-30 13:17:55 UTC
From: Mark Pilant
Topic: 13478 Message: 13480

The ones I have measure:

Depth Width Height
RV-4 12-1/4" (31.1 cm) 10-3/4" (27.3 cm) 6-1/8" (15.6 cm)
TR-4 15-1/8" (38.4 cm) 10-3/4" (27.3 cm) 6-1/8" (15.6 cm)

These measurements include the standard feet at each corner for the height and the tuning knobs for the depth.

I hope this helps.

Remember that we always remove the AC4 from the MS4 or RV4 cabinets for shipping. I doubt that your trip is as much an ordeal as shipping, but I think I might remove the AC4 just in case. After a couple of experiences the other way, the damage is significant!! Enjoy your "new to you" Drakes!!

Chris -

The crystalswere selected and marked for their 'DRIFT with
temperature' characteristics. These are determined by the precise
angle of the crystal cut, and to my knowledge don't change with aging.

Some crystals drift up with temp, some drift down, and some are
relatively flat, again depending upon the angle of cut. It's been 40
years, but my best recollection is that Red drifted up, Green was
pretty flat, and Blue drifted down. I have seen a very few 'Y'ellow,
but never any description. Perhaps they had an 'S' curve!! :-)

'Matched' color units hold TRANSCEIVE align very well in most cases.
Obviously fans and climate controlled rooms help. Of course, all of
this is ONLY of importance if you like to transceive on SSB. Generally
speaking, anything over ~30 Hz difference becomes noticeable on SSB.

By the way, the C-Line resolved the problem by sending a sample of the
CAR OSC signal over tothe receiver for use as the 3rd IF LO, locking
the two together.

13484. T4XC on AM

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-30 15:40:08 UTC
From: Abqcooks@...
Topic: 13473 Message: 13484

Greetings to the group,

Just wondering what anyone may know about operating the T4XC on AM.
Mine works FB on CW and SSB and thought I would give it a try on AM. The manual
says the carrier is held at "a few watts" with no modulation and that with modulation the plate
current should kick to .15
Upon trying mine I find that with PTT and no modulation I am getting about .20 plate amps and 25w output.
That's probably more than the "few watts" that the manual speaks of. So I thought I had better pause and
ask what others have experienced when operating AM. Any hints or cautions much appreciated.
Not sure the finals would really appreciate AM anyway but figure I should proceed with some caution
and some advice. 73 and thanks Jim

I've had mixed results with Westinghouse. I assume they do NOT
manufacture 6JB6s, just remark them. I've had a couple that _would
not_ neutralize, although they 'looked' identical inside, even with
changes in the neutralization cap(s). I had another pair someone
brought with a unit to repair, allegedly new in box, looked new, but
very low output (50W). Don't recall any dimensional problems, but you
never know since they could have been BUILT by anyone.......

I avoid 'em.

That's kinda high. 10 - 15 watts is more typical. A weak V7 or R63
or 15k resistors changed value?

The 'kick to 0.15A' is a wild guess since the limitation is peak
power. The 0.15A is what we thinkthe meter shows when it's really
peaking at 350 mA or so. You really shouldn't run AM like this unless
you have a scope on the output. THERE IS NO ALC ON AM!!

manufacture 6JB6s, just remark them. I've had a couple that _would
not_ neutralize, although they 'looked' identical inside, even with
changes in the neutralization cap(s). I had another pair someone
brought with a unit to repair, allegedly new in box, looked new, but
very low output (50W). Don't recall any dimensional problems, but you
never know since they could have been BUILT by anyone.......

I avoid 'em.

13488. TR-4 R187 trimmer

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-30 22:38:52 UTC
From: slowcountry1
Topic: 13488 Message: 13488

I have lost the 1K R187 trimmer in my project radio. The manual doesn't say what wattage it needs to be rated for. What can I get away with here?

Thanks,

Doug N9XTF

13489. Re: TR-7 Station - What is it worth?

Topic: 13471 Message: 13489

Thanks for the links Jim! Those should help.

As for the included equipment, it was all spelled out on the web link I provided including serial #S. The TR7 has the DR-7 display board, the NB-7 (later model as I recall) The FS-7 fan, The optional 300 and 1800 Hz filters. Supporting equipment include a Drake mic, PS-7 power supply with a Boxer fan (identical mounting), an RV-7 VFO all manuals in excellent condition and Service Manual.

I recently discovered this TR-7 has been modified for continuous transmit. The owner was a MARS affiliate.

The second link you offered brings up a question. Why is a TR-7 worth more than a TR-7/PS-7 combination?:Typo?

TR-7 12 $400.00 $661.35 $1,250.00
TR-7/PS-7 12 $250.00 $546.42 $800.00

Always nice to meet another 'C' call!

Bob

My guess would be auction site frenzy over an unusually pristine, possibly "new-in-box", specimen. ISTR a couple of years ago that a guitar player of some note who is a ham spent a lot of money on such a unit.

>Always nice to meet another 'C' call!

Indeed.

13491. Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-01 01:04:44 UTC
From: slowcountry1
Topic: 13108 Message: 13491

Garey,

While troubleshooting the low 10M sensitivity last evening I lost R53, R187 trimmer, R168 and R71. I thought I had it traced down, replaced the burnt resistors and inserted a newer trimmer as a test. Upon power up, I instantly burnt all of the afore mentioned resistors for the exception of the trimmer.

Do you offer repair services on the TR4 line or recommend someone to completely go through this thing. I have wasted way too much time and continue to come up short. Its time a professional take care of it for me.

Thanks for your time,

N9XTF

I was unable to see this clearly enough on the CD's, its in a tight spot. I make a hand drawing and take pictures before I change anything to ensure that I place parts back where they came from however; this one was already in the wrong place so it went back wrong, oops!
> > >
> > > The serial number is 26095, from what I can tell, it more resembles a TR-3 than the pictures of the TR-4.
> > >
> > > The rig had a 6BZ6 at V-11 when I started. The rig calls for a 12BZ6 so that's the first thing I replaced. V-7 is a 12BA6 which I've swapped out a couple of times. The stage that I'm at is tolerable however; my idea was to dedicated this rig to 10/15M service, so this is why i'm concerned with sensitivity on 10M. My TR-4CW with the NB will be dedicated to the lower bands and my TR-6 for 6M.
> > >
> > > I have tried multiple harmonics of the calibrator signal; have not noticed anything any stronger from one to the other.
> > >
> > > Also, as suggested on my tuning complaint earlier in the series of messages, I DeOxit the Plate and loading caps and replaced the ball bearing grease. The plate and load caps are very smooth now and tuning is much smoother however; the plate cap still produces somewhat of a jumpy response in the tuning process. I have checked the grounds on the air variables as well. Is this possibly a coupling capacitor?
> > >
> > > I can not believe all of the foul connections and screwy modifications that I have run across on this one. I lost the filament voltage on two of the 6JB6s and the other 6volt tubes the other night. The filament voltage lead off the first PA tube was partially cut and I did not notice it and then it finally broke off. After I get the darn thing working 100%, I'm going to have to go back and re-dress / replace some coax, wire and such that have iron burns and such from previous owners to make it look halfway decent. Its such a great radio its a shame its had such a rough life.

After sitting a parts rig next to my TR-4, we found that a mica cap (don't remember which number it is) was placed on the wrong leg to T-9. After moving it to the correct leg, on cal 15M produces S-9 and 10M now produces about S-4. We went back through all of the alignment and everything was pretty close. Section E, adjustment of Injection Couplers had to be done without the alignment load on 10M. When using the alignment load the S-meter has no deflection and cannot determine proper calibration. Any ideas here?

All of the voltages to TP were positive so I adjusted L1, L2 and L5; I was able to bring them down but only close to zero, could not obtain a negative voltage. I swapped out V1 with a used tube and got 40M to -.39VDC 15M to -.43VDC and 10M to -.42VDC. I did not have a new tube so today I replaced V1 with a new Amperex 6U8A tube that I had (I tried the tube from V3 it wasn't any better). I was then able to get 40M to -1.512VDC 15M to -1.482VDC and 10M to -1.34VDC. For smiles and grins, I replaced V3, assuming it was soft, with a new Amperex 6U8A tube. I have a bunch of these from a sale somewhere but I didn't have any 6EA8 new replacements.

13492. Re: [DrakeRadio] Re: TR-7 Station - What is it worth?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-01 02:36:18 UTC
From: Garey Barrell
Topic: 13471 Message: 13492

Bob -

You've run into one of the problems with that type of list.... It only reports on a 'sale', without regard for what is included, or not. The TR-7 'may' have had three filters and a Noise Blanker in it, or a fan, or ...

Best pricing I have found is to look at the completed sales on eBay and eHam and evaluate what each one was and it's condition. You see a pattern after awhile! Then knock about 20% off of the average eBay price and you'll be close for a direct sale.

If you absolutely want to get the most for it, take outall the accessories and put it all in separate auctions.

73, Garey - K4OAH
Glen Allen, VA

Drake 2-B, 2-C/2-NT, 4-A, 4-B, C-Line

Good reports were received and the radio seems to be working well. Power output into a dummy load is 140W (less on 15 and 10M).

13493. Re: [DrakeRadio] Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-01 02:40:09 UTC
From: Garey Barrell
Topic: 13108 Message: 13493

Doug -

Sounds like you may have a short in the S-Meter wiring.

There are a couple of good service guys, WA8SAJ and WB4HFN are two of the best. They are backed up, but do good work. Course you don't learn anything that way!! :-)

73, Garey - K4OAH
Glen Allen, VA

I was unable to see this clearly enough on the CD's, its in a tight spot. I make a hand drawing and take pictures before I change anything to ensure that I place parts back where they came from however; this one was already in the wrong place so it went back wrong, oops!
>>>>
>>>> The serial number is 26095, from what I can tell, it more resembles a TR-3 than the pictures of the TR-4.
>>>>
>>>> The rig had a 6BZ6 at V-11 when I started. The rig calls for a 12BZ6 so that's the first thing I replaced. V-7 is a 12BA6 which I've swapped out a couple of times. The stage that I'm at is tolerable however; my idea was to dedicated this rig to 10/15M service, so this is why i'm concerned with sensitivity on 10M. My TR-4CW with the NB will be dedicated to the lower bands and my TR-6 for 6M.
>>>>
>>>> I have tried multiple harmonics of the calibrator signal; have not noticed anything any stronger from one to the other.
>>>>
>>>> Also, as suggested on my tuning complaint earlier in the series of messages, I DeOxit the Plate and loading caps and replaced the ball bearing grease. The plate and load caps are very smooth now and tuning is much smoother however; the plate cap still produces somewhat of a jumpy response in the tuning process. I have checked the grounds on the air variables as well. Is this possibly a coupling capacitor?
>>>>
>>>> I can not believe all of the foul connections and screwy modifications that I have run across on this one. I lost the filament voltage on two of the 6JB6s and the other 6volt

tubes the other night. The filament voltage lead off the first PA tube was partially cut and I did not notice it and then it finally broke off. After I get the darn thing working 100%, I'm going to have to go back and re-dress / replace some coax, wire and such that have iron burns and such from previous owners to make it look halfway decent. Its such a great radio its a shame its had such a rough life.

Garey,

Is the procedure to set the BAL MOD on your TR4 any disk?

Walt, KA2NJF

From: DrakeRadio@yahoogroups.com [mailto:DrakeRadio@yahoogroups.com] On Behalf Of Garey Barrell
Sent: Monday, April 29, 2013 12:33 PM
To: DrakeRadio@yahoogroups.com
Subject: Re: [DrakeRadio] Re: TR-4 Repair

Doug -

Whoops! Those pesky connections insist on being made to the correct pin..... :-) This is one of the places where the CD comes in very handy. See my first message at the bottom of thisstring!

I wouldn't worry about the Section G. problem. This methodof setting the BAL MOD was written for the early TR-4 with 4 pole filters (soupcan). The newer sixpole filters have sharper skirts, making the CAR OSC signal too far down to overcome idle current. Later BAL MOD adjustments need to be done with a scope or separate receiver and the adjustments made to minimize the carrier feedthrough. You should be able to null it almost to zero on the scope or well into the noise on a separate receiver.

Have you tried listening to a different harmonic of the CAL? The level can vary quite a bit up there from harmonic to harmonic.

I don't see your s/n here. Do you have a 12BA6, a 12BZ6 or a 6BZ6 at V11? Also, sub V7.

Yes, the audio preamp stage is a big help.

Progress, you're getting there.....

From: Garey Barrell
Topic: 13108 Message: 13495

Walt -

No, but there's really nothing special about it. You just follow the instructions inthe original manual (also on the CD) and instead of watching the PLATE meter for the null, you either use a scope on the output or just listen on a separate receiver. Just pick a band, say 40M, switch to SSB, key the PTT with the XMTR GAIN at 0. Listen on your separate receiver to the transmitter frequency and you'll probably hear a weak carrier. Peak up the RF TUNE, PLATE and LOADcaps for maximum signal in the receiver. Then begin adjusting CAR BAL pot and C127 (top of chassis, right rear) for minimum signal in the receiver. You can use this same setup to peak T14 etc., as part of the CAR OSC setup.

13496. Carrier Oscillator Adjustment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-01 03:29:36 UTC
From: Don Cunningham
Topic: 4504 Message: 13496

Garey,

This is probably VERY simple, but please go over the adjustment of the carrier oscillator using the external receiver. I keep seeing you reference that, but can you break it down a bit for us old Rednecks that aren't very smart???? HI

From: Garey Barrell
Topic: 4504 Message: 13497

Hi Don -

Nosecret handshake required!! :-)

According to the manual, you unbalance the BAL MOD to allow some carrier through. Peak T14. Then key the transmitter in SSB with GAIN at 0, then switch between USB and LSB, then watching for equal plate current adjust C2. Peak the transformers and then re-null the carrier. With the earlier radios you would see some signal above the idle current due to the unbalanced carrier.This method worked fine for the 4 pole filters in the T-4X and the early TR-4s. When Drake changed to 8 pole filters, (T-4XB and TR-4 ~s/n 19500,) the filter skirts were so sharp that it was impossible to get enough carrier through even when the BAL MOD was drastically unbalanced.

So, we know there was 'some' carrier getting through, just not enough to show on the meter above the idle current. Simple, we just needed a more sensitive detector to be able to 'see' the carrier and then null it.

There are two easy ways to do this. One is to hook your scope across the dummy load, and proceed as above. The other, more sensitive detector is a separate receiver tuned to the output frequency of the transmitter. Unbalance the BAL MOD and tune in the transmitter signal. Peak all the usual suspects, RF TUNE, PLATE and LOAD, for maximum signal. Thenproceed as above to peak the appropriate transformers, center the CAR OSC, and then adjust the pot and cap to null the CAR OSC. You should be able to get it down into the noise level of the receiver.

From: Don Cunningham
Topic: 4504 Message: 13498

Thanks, Garey. I was not sure I'd remember a secret handshake, for sure!

I would have been close, and that is an easy one. I'll give that a shot soon on the pesky T4XB I have. It just wouldn't show enough to know where you are, and i got good audio reports on USB, "tinny" reports on LSB, so I knew where to look.

Tks again.

13499. For Garey, et al: My non-working TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-26 14:18:18 UTC
From: Howard Traxler
Topic: 13499 Message: 13499

Hello again Garey. Sure hate to keep bothering you with this thing, but,

Finally got the XYL down there to watch the meter while I fired up the TR-4 as you suggested. I think she's getting a bit tired of my TR-4. Wish I could find an effective way to check it myself.

In any case, setting it up as you say (below), listening on a nearby receiver, there is a signal increase when I move the RF Tune and Plate Tune and not so much when I increase the drive gain. Plate current does not rise from the 100 ma biased point.

Does that give you any ideas what to check next? Will the xmtr not working cause the rcvr to not work? That was the first thing I noticed; the receiver went dead

Thanks, Garey.

73,
Howard, WA9RYF

Date: 2013-05-01 22:27:18 UTC
From: Walter Milton
Topic: 4504 Message: 13500

Garey,

How does one hook their O-scope across the dummy load? I do not have enough room on my work bench to place a second radio. So that route is out for me at present. I have an O-scope and would like to try that method. Thanks

Walt, KA2NJF

Hi Don -

Nosecret handshake required!! :-)

According to the manual, you unbalance the BAL MOD to allow some carrier through. Peak T14. Then key the transmitter in SSB with GAIN at 0, then switch between USB and LSB, then watching for equal plate current adjust C2. Peak the transformers and then re-null the carrier. With the earlier radios you would see some signal above the idle current due to the unbalanced carrier.This method worked fine for the 4 pole filters in the T-4X and the early TR-4s. When Drake changed to 8 pole filters, (T-4XB and TR-4 ~s/n 19500,) the filter skirts were so sharp that it was impossible to get enough carrier through even when the BAL MOD was drastically unbalanced.

So, we know there was 'some' carrier getting through, just not enough to show on the meter above the idle current. Simple, we just needed a more sensitive detector to be able to 'see' the carrier and then null it.

There are two easy ways to do this. One is to hook your scope across the dummy load, and proceed as above. The other, more sensitive detector is a separate receiver tuned to the output frequency of the transmitter. Unbalance the BAL MOD and tune in the transmitter signal. Peak all the usual suspects, RF TUNE, PLATE and LOAD, for maximum signal. Thenproceed as above to peak the appropriate transformers, center the CAR OSC, and then adjust the pot and cap to null the CAR OSC. You should be able to get it down into the noise level of the receiver.

Date: 2013-05-02 00:19:08 UTC
From: William Houghton
Topic: 4504 Message: 13501

I use adapters:

- BNC "T" that has two females and one male.
- a male PL-259 to BNC female.
- a BNC male to SO-239 female.

Connect the male of the BNC "T" to the PL-259 to BNC female.
Attach the PL-259 to the rig.
Attach the BNC male to SO-239 adapter to one of the BNC females of the "T".
Connect the coax to the dummy load to the S0-239.
The scope probe will usually fit into the center of the remaining BNC female. I also have a BNC male to aligator clip leads adapter that I can use.

Garey,

How does one hook their O-scope across the dummy load? I do not have enough room on my work bench to place a second radio. So that route is out for me at present. I have an O-scope and would like to try that method.
Thanks

Walt, KA2NJF

Be careful doing this at power, many scope front ends won't withstand the voltage of 100W into a 50 ohm load (70.7 V). You can divide the signal with non-inductive high-value resistors of the appropriate ratio. If the divisor resistors sum to at least, say, 5kohm, they won't substantially affect the impedance of the dummy load. You can also use a capacitive tap; a metal box with two SO-239s, a wire between, and a BNC with an insulated wire dangling into the box but not connected works great. You can increase or decrease coupling (and thus the voltage at the scope) by bringing the insulated wire closer to the pass-through wire or even coiling it around.

You can also use a capacitive divider, but its impedance in parallel with the load is going to be frequency-dependent.

For nulling the carrier none of the above is likely to be critical, because you won't be putting that much power into the dummy load. It's not uncommon for scope front ends to only withstand 10-20V at HF, though, which is only a few watts of power into 50 ohms, so be careful!.

Walt -

Kinda depends upon the scope. Simplest is just a 'TEE' connector at
the dummy load. You don't have much transmitter outputdoing the test,
BUT You MUST remember to unhook the scope before you key the
transmitter for output power!! 200W into 50 ohms is only 100 Volts,
which most scope attenuators can handle. But to be safe, disconnect
the scope before keying at full power.

Excellent point. That's what I was just cautioning about. "Good"
scopes often do NOT withstand RF voltages well at all.

For CAR BAL, it's not of concern, but you gotta be careful. A piece
of insulated hookup wire, with a little bit stripped off of the end,
clipped witha 10x probe, and the wire pushed through a holein the cage
about halfway down works great for full power monitoring! :-)

We used an RF probe on the output connector with the audio input connector shorted, while being employed at the Heathkit Service Department. That always seemed to work well to null the carrier as you could vary the range on the meter to increase the sensitivity and I was able to get the carrier null output down below .05 volts RF on both sidebands. That was in the late '60s with the SB100, SB400, HW100 series radios.

This thread is getting a bit warped. We are NOT concerned with carrier null, the original question was about the Carrier Oscillator adjustment to insure that both sidebands are as centered as you can get so the audio response of each sideband is close to the same. The "tinney" audio reports come when this is misadjusted.

I use a 10:1 scope probe set for 10X and a T connector.
For using a receiver usually there is enough leakage from
the final to hear it fine with a foot or two of wire on the
receiver. The scope makes it easier to center the carrier
frequency for equal level on the two sideband filters.

I have exactly one 6JB6 that is too tall but can't
remember who made it, an odd brand I think. Its much too
tall, a very odd tube.
As far a Westinghouse they certainly made industrial
tubes and were a member of the RCA club that was
cross-licensed for all patents but I don't know if they made
receiving tubes, I can't think of any I've ever seen. RCA,
General Electric, Sylvania, Hytron (later became CBS) and a
couple of others actually make the tubes carrying their
brands. Ken-Rad was a division of GE, the name means
Kentucky Radio and I think they were originally independant.
They were in Owensborough Ky which was also the GE tube and
small lamp factory. I think Zenith tubes were mostly
Sylvania but I don't know who made Philco tubes.

I prefer to use a x10 probe either hooked up to inside the chassis at the connector, or fashion a way of attaching the probe to the tee. Most scopes made in the last 40 years can go to 50V/div this way.

Don -

Then that's MY fault!! :-) I understood you were having trouble
adjusting the BAL MOD using the procedure in the manual.

Centering the CAR OSC is best done with a counter. If the filters are
ok, then setting the CAR OSC to 9.000 MHz should work fine. If you
don't have accessto a counter, then do the unbalance of the BAL
MOD.Assume you are using a sensitive enough detector to be able to see
it, and then switching back and forth between USB and LSB while
adjusting the CAR OSCfor equal output. This is not quite as good, as
there is some ripple in the filter passbands, meaning that the
identical levels aren't exactly on the same spot of the filter response.

Yet another method is using a scope with a two-tone generator (present
in the Heath Monitorscopes and others) and setting the CAR OSC for the
best response on both sidebands.

One more, and I'll shut up. If you have a calibrated audio oscillator
(or a counter capable of counting the audio, included in a lot of the
Chinese DMMs!), you can vary the input frequency to the MIC input.
Quickest is to just note the frequency where the output drops quickly
at the high and low ends. Should be around 400 - 2900 Hz, and more
importantly similar on both sidebands.

The code 312 that you mention is a Sylvania manufacture date code. The date code was used by the dealers for tube manufacturers to determine if an early tube failure qualified to be replaced under warranty. Tubes from different manufacturing lots would have a different date code.

RCA used a reddish-orange ink to print their logo and the tube ID on their tubes. When the tube is heated up, that ink would turn a muddy gray color. In case the buyer wanted to return an "unused" tube for refund, that color change was used by the dealer to determine if a tube would be accepted back for resale as unused.

I don't know for sure about other tube makers than RCA, but I suspect the others used the same kind of color change ink.

John K7KEY

> I used Sylvania and GE tubes for my replacements for all the repairs . I recall that tubes made by sylvania for others had a code number 312 on the envelope . not sure about the green sylvania's . most of the ones I used were yellow printed . the tubes by other manufactures probably had similar codes for ID purpose .

Maybe that's why I was having trouble getting my head around that last one you sent :-)!! I'll try one or more of those, as I do have a good counter AND several two tone generators. I should be able to master that this time.

Also, my "dummy load" is really a 30db attenuator that was used in broadcasting for that very purpose, as I understand it, to "proof" radio/tv stations. Rated at 2500W, so may attenuate too much, but I'll see if it works to null the carrier. I have a small dummy load screwed onto it, and it handles all my amps just fine. A friend let it go for $20. Now, that was a deal and I drove to Dallas quickly with a twenty dollar bill, hi.

On a humorous note I have an old TV tube made by CBS-Hytron (a "division of Columbia Broadcasting System")
and its advertising logo on the box says the tube is "for new set sparkle" .
I chuckle at that thinking that if only I had a tube socket located somewhere from the neck up I could plug that tube in
and 'sparkle' like I did in my 20s ! Jim

I have exactly one 6JB6 that is too tall but can't
remember who made it, an odd brand I think. Its much too
tall, a very odd tube.
As far a Westinghouse they certainly made industrial
tubes and were a member of the RCA club that was
cross-licensed for all patents but I don't know if they made
receiving tubes, I can't think of any I've ever seen. RCA,
General Electric, Sylvania, Hytron (later became CBS) and a
couple of others actually make the tubes carrying their
brands. Ken-Rad was a division of GE, the name means
Kentucky Radio and I think they were originally independant.
They were in Owensborough Ky which was also the GE tube and
small lamp factory. I think Zenith tubes were mostly
Sylvania but I don't know who made Philco tubes.

Garey -

Thanks for your input. I'm not interested in getting top dollar for the equipment; I'm more interested in it getting into the hands of someone who can put it to good use. I've talked to the elderly owner and he is really just happy to have it out of his place (he's now living with his son's family).

Right now I'm trying to avoid shipping. A few years ago I shipped a Drake L-4, and the hassle packing it (three boxes - the tubes and power supply each went in their own box.) I'd sure like to find a buyer in the local Southern California area (I'm in Orange County).

Thomas -

Not a whole lot of difference between them. The T-4XC has a fewmore SS stages, but functionally it is identical to the T-4XB.

The differences are in the receiver. The natural 'pair' would be an R-4C which is an excellent receiver. It IS a more expensive receiver than the "B", especially when you consider that the crystal IF filters for the "C" are optional at extra cost, as is the Noise Blanker.

Many prefer the "B" receiver because it has four L/C filter bandwidthsstandard, and a noise blanker. Some also prefer the gentler slopes of the L/C filters in the Passband Tuner over the sharp edged crystal filters in the "C".

One operational advantage the "C" _pair_ offer is locked oscillators so that transceive operation is always exactly on frequency. The "B" has two separate crystal oscillators thatwill drift slightly with temperature changes, meaning that transceiveoperation isn't always 'perfect'.

So. A lot depends upon what modes you operate, do you prefer to transceive(typically only pertinent to SSB operation,) do you tend to rag-chew or dig through pileups for DX, or are you into contesting?

If you need the sharpest filters for DXing or contesting, the you'd want to consider the R-4C with the additional filters. If you just want to indulge in day-to-day ham conversations you might prefer the smoother, gentler sound of the R-4B. Kind of like comparing a NASCAR auto with a family sedan. Both will get you to the grocery store, but if you like the noise and performance and can tolerate the stiff shocks, the NASCAR version is going to outperform the family sedan!

Bottom line, either transmitter will work fine with either receiver, only giving up the locked transceive capability with the R-4B.

On the surface, this sounds like a contact issue and I would suspect the switch contacts around the band oscillator. If you can't receive when using the XMTR as the frequency control of a set of Twins, check the band oscillator.

If you have a scope you can easily monitor the output of the crystal oscillator as you change bands. Also, be sure, if you just bought this rig, that there are five crystals underneath the PTO area.

One quick check, is the XTALS switch in the NORM position??

Otherwise, sounds like Steve has it nailed. If you are set up for transceive, try transceiving with receiver control. The transmitter should work on all bands.

Good point to check and be sure all the BAND crystals are present.

13529. R-4 FS

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-03 17:21:33 UTC
From: Steve Wedge
Topic: 13529 Message: 13529

I'd dearly love to keep this receiver but I gotta pay the bills. It's with a tear in my eye that I'm prepping my R-4 for sale.

This is in the most incredible, original condition of any early Drake radio that I have ever seen!

The copper chassis is as close to flawless as I've ever seen (two small "freckles" are all that's evident) and from what I can tell, all the tubes are original. The factory inspection tag is still on the cord (s/n 0936) and indicates it was tested on St. Patty's Day of 1965. All the tube date codes pre-date the test date by 1 - 3 months. All are RCA or Sylvania and have the original markings on them.

This set only needed for me to blow out the dust, re-grease the PTO and PBT and align it. The alignment will be finished by the end of the weekend.

This set is as close to museum quality as you will find. I also have the matching speaker, which is also in near-mint shape!

Email me off-list for pricing and photos. I'll have the photos ready as soon as the alignment is done.

If you bought it for the price of an older set, you got a good deal, Thomas!

As Garey points out, it can be used with any of the other receivers.

So. A lot depends upon what modes you operate, do you prefer to transceive(typically only pertinent to SSB operation,) do you tend to rag-chew or dig through pileups for DX, or are you into contesting?

If you need the sharpest filters for DXing or contesting, the you'd want to consider the R-4C with the additional filters. If you just want to indulge in day-to-day ham conversations you might prefer the smoother, gentler sound of the R-4B. Kind of like comparing a NASCAR auto with a family sedan. Both will get you to the grocery store, but if you like the noise and performance and can tolerate the stiff shocks, the NASCAR version is going to outperform the family sedan!

Bottom line, either transmitter will work fine with either receiver, only giving up the locked transceive capability with the R-4B.

13532. T-4XC - annoying note in SSB mode

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-03 22:48:17 UTC
From: Steve Wedge
Topic: 13532 Message: 13532

I'm suspecting that an electrolytic is drying out, but I offer this up to the group:

Just received a T-4XC. It's in nice shape and has full output. I may end up keeping this one. When the MODE switch is in SSB, however, I get a constant tone, about middle G (so, around 350 - 400 Hz) - regardless of the settings of the other controls. If I unplug the INJ cable, the noise ceases. This is when I have the transmitter paired to my R-4B (not a C). The tone volume is independent of settings of VOX, ANTI VOX and GAIN controls

In CW mode, there's no tone.

I will be going through this anyway but am looking for any quick assessments as to why this tone manifests itself only in SSB and only when the INJ jacks are connected between the two.

Subject: Re: [DrakeRadio] Carrier Oscillator Adjustment

Walt -

Kinda depends upon the scope. Simplest is just a 'TEE' connector at the dummy load. You don't have much transmitter outputdoing the test, _BUT_ You MUST remember to unhook the scope before you key the transmitter for output power!! 200W into 50 ohms is only 100 Volts, which most scope attenuators can handle. But to be safe, disconnect the scope before keying at full power.

13535. Re: [DrakeRadio] Carrier Oscillator Adjustment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-04 02:18:11 UTC
From: Garey Barrell
Topic: 4504 Message: 13535

Walt -

That'll work just fine. Look back over the last few messages, there were several suggestions for ways to sample the output signal of the transmitter.

I would advise leaving the scope connected while transmitting without investigating the breakdown voltage of your probe and scope input. 200W input to a 50 ohm load is almost 300 Volts peak-to-peak, exceeding the range of many 'good' probes.

Attached is the procedure to set the Transceive Align. You would not
need it if you were using an R-4C, but with the R-4B it is required if
you want to have both units on the same frequency.

Just substitute 'T-4XC' where it says 'T-4XB' and it'll work fine.

From: kf5str
Topic: 13456 Message: 13539

Thanks Richard. I think I'm getting the hang of it. The watt meter made it much easier. The dip is hard to see on the radio's meter and I wasn't even sure it was there until somebody told me it would be very slight. The swr/watt meter also reminded me of the high swr on the antenna I'm using so will have to get a tuner in the near future. I dont want to worry about damaging the transmitter. Any tuner recommendations? Also I discovered the mic jack is not the standard 1/4 size. Do you know what it is? I've read the D-104 mics work well with tube radios but the few I've seen on ebay all have pinned connectors. Did Astatic offer those mics with the right connector or did Drake owners have to add the plug if they wanted to use that particular mic?

>
> Dave

If you mean the dip after increasing loading it is hard
to see. However, if the amplifier is neutralized correctly
the dip will coincide with the peak in RF output. So, once
loading has been brought up to the maximum level the plate
resonance is best seen by looking for a peak in the output.
Once you get used to tuning up the Drake you can tune
any linear amplifier that isn't automatic. Some have more
adjustments for grid tuning or drive but all are essentially
the same.
The mic jack is 3/16ths inch also used by Collins and a
standard on aircraft radios. While they are supposed to be
rare they are not. The plugs including the right-angle plug,
are made by Switchcraft as type S-230 and are available from
many places. Someone changed the jack on my T4XB to a 1/4
inch jack. It was well done so I've just left it alone but
don't suggest modifying the rig. My TR-4 has the original
plug.
The D-104 is a well respected microphone designed for
good speech intelligibility but is not the most pleasant to
listen to. It has about the right rising characteristic to
boost speech in noise. The problem with crystal mics is that
they want to work into an open circuit. The microphone

element looks like a capacitor so any resistance in series with it acts like a high pass filter. Most vacuum tube amps have just about high enough impedance so that the mic doesn't sound tinny.
After testing a number of microphones (I collect them) I found the Electro-Voice 664 seems to get the best reports and sounds best to my ear. There are many newer mics that would be just as good. A cardioid microphone has the advantage of discriminating against background noise which makes you signal sound better on the air. It is also less sensitive to pick up from the receiver speaker making the anti-vox more effective.
Nearly all microphones came originally with bare wires. You just remove whatever plug is on it and rewire it with what you need. The wiring for the plug is simple, the mic goes between the sleeve and ring, the push to talk button (if you use one) goes to the tip. If you don't have push to talk leave the tip unconnected.
There are data sheets for nearly all microphones on the web. They will tell you what the pin connections or wire color code is for a particular microphone.
BTW, there is a good web site dedicated to Drake radios at:

13541. Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: slowcountry1
Topic: 13108 Message: 13541

Garey,

Ok, I'm back at it. Going back over the rig I have discovered T-14 has been modified, or at least it has been opened, and the associated wiring around it has been modified. I have compared it to a couple TR-4Cw parts rigs and the wiring in this area is quite different. I cannot find a picture on the internet, showing the area, with a serial number close to mine to verify that this was not the original configuration. Is there anything in this area that would effect 10 and 15M receive?

I went through the S-Meter chain and was unable to find a short. I disconnected the meters, made sure the wiring was not shorted where they exit the mounting plate etc. I did not find any source for the problem however; I replaced R-71 with a flameproof 500 ohm 1/2 watt resistor and all seems to be fine in this area and now have the receiver working again. I have no clue here.

Regards,

Doug N9XTF

The stage that I'm at is tolerable however; my idea was to dedicated this rig to 10/15M service, so this is why i'm concerned with sensitivity on 10M. My TR-4CW with the NB will be dedicated to the lower bands and my TR-6 for 6M.
> >>>>
> >>>> I have tried multiple harmonics of the calibrator signal; have not noticed anything any stronger from one to the other.
> >>>>
> >>>> Also, as suggested on my tuning complaint earlier in the series of messages, I DeOxit the Plate and loading caps and replaced the ball bearing grease. The plate and load caps are very smooth now and tuning is much smoother however; the plate cap still produces somewhat of a jumpy response in the tuning process. I have checked the grounds on the air variables as well. Is this possibly a coupling capacitor?
> >>>>
> >>>> I can not believe all of the foul connections and screwy modifications that I have run across on this one. I lost the filament voltage on two of the 6JB6s and the other 6volt tubes the other night. The filament voltage lead off the first PA tube was partially cut and I did not notice it and then it finally broke off. After I get the darn thing working 100%, I'm going to have to go back and re-dress / replace some coax, wire and such that have iron burns and such from previous owners to make it look halfway decent. Its such a great radio its a shame its had such a rough life.

After sitting a parts rig next to my TR-4, we found that a mica cap (don't remember which number it is) was placed on the wrong leg to T-9. After moving it to the correct leg, on cal 15M produces S-9 and 10M now produces about S-4. We went back through all of the alignment and everything was pretty close. Section E, adjustment of Injection Couplers had to be done without the alignment load on 10M. When using the alignment load the S-meter has no deflection and cannot determine proper calibration. Any ideas here?

All of the voltages to TP were positive so I adjusted L1, L2 and L5; I was able to bring them down but only close to zero, could not obtain a negative voltage. I swapped out V1 with a used tube and got 40M to -.39VDC 15M to -.43VDC and 10M to -.42VDC. I did not have a new tube so today I replaced V1 with a new Amperex 6U8A tube that I had (I tried the tube from V3 it wasn't any better). I was then able to get 40M to -1.512VDC 15M to -1.482VDC and 10M to -1.34VDC. For smiles and grins, I replaced V3, assuming it was soft, with a new Amperex 6U8A tube. I have a bunch of these from a sale somewhere but I didn't have any 6EA8 new replacements.

Doug -

Hmmmm... I wouldn't expect T-14 to have any band-related
difficulties. It's the same on all bands. T-14 is sometimes opened
to replace the diodes, and in a few cases I haveseen the diode lead(s)
short to the can, making it impossible to null the carrier.

Only 10M problems, and judging from the other things you have found,
I'm convinced someone butchered up this radio in an attempt to put it
on 27 MHz. Obviously that someone knew just enough to be dangerous.

You can see pretty much everything around T-14 on the CD. You can
blow up the pix at least 600x on screen, and that area is pretty
accessible. This area was essentially the same in all versions, since
there were no real changes all the way back to the TR-4.

The only other thing I could think of on the S-Meter circuit smoke
would be a shorted tube or something else on the Plate or Screen lines
of the AVC controlled tubes.

I disconnected the meters, made sure the wiring was not shorted where they exit the mounting plate etc. I did not find any source for the problem however; I replaced R-71 with a flameproof 500 ohm 1/2 watt resistor and all seems to be fine in this area and now have the receiver working again. I have no clue here.

After sitting a parts rig next to my TR-4, we found that a mica cap (don't remember which number it is) was placed on the wrong leg to T-9. After moving it to the correct leg, on cal 15M produces S-9 and 10M now produces about S-4. We went back through all of the alignment and everything was pretty close. Section E, adjustment of Injection Couplers had to be done without the alignment load on 10M. When using the alignment load the S-meter has no deflection and cannot determine proper calibration. Any ideas here?

All of the voltages to TP were positive so I adjusted L1, L2 and L5; I was able to bring them down but only close to zero, could not obtain a negative voltage. I swapped out V1 with a used tube and got 40M to -.39VDC 15M to -.43VDC and 10M to -.42VDC. I did not have a new tube so today I replaced V1 with a new Amperex 6U8A tube that I had (I tried the tube from V3 it wasn't any better). I was then able to get 40M to -1.512VDC 15M to -1.482VDC and 10M to -1.34VDC. For smiles and grins, I replaced V3, assuming it was soft, with a new Amperex 6U8A tube. I have a bunch of these from a sale somewhere but I didn't have any 6EA8 new replacements.

13543. Drake L4B power supply temperature

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-05 03:05:53 UTC
From: Patrick Ross
Topic: 13543 Message: 13543

I recently acquired a Drake L4B complete with matching Power Supply fitted with the Harbach board mod.

My question is, what is the acceptable "normal" temperature for the Power Supply under operating conditions - say full output on SSB for about 10 minutes?

I find that the case on the Power Supply HV transformer gets very warm, notwithstanding that it out in the open and in a well ventilated area. I am concerned about overheating due to lack of fan/integral cooling system.

Interested in your experience.

Tnx, Patrick

Patrick -

You can never have too much air on tube gear, unless it blows the tube(s) out of the socket(s). I think it was Bill Orr, W6SAI (SK), who said that. If not it was one of his buddies at Eimac!

I run a 4" 'BOX' type fan just lying on top of the power supply, blowing UP!. It doesn't have to be a turbine, just enough (silent) to 'encourage' that hot air to keep on rising, and get it away from the area. I also put a fan on top of the L-4B,right over the tubes, same type, blowing up, for the same reason. The PS and the amp right over the tubeswill get too hot to comfortably hold your hand on. With the fan(s) it's near room temperature.

Bottom line, both will work for a long time without the fans. Fans are cheap, especially 220 or 24V fans on 120 or 12V, so why wouldn't youuse them?

Date: 2013-05-05 14:02:38 UTC
From: Patrick Ross
Topic: 13543 Message: 13545

Hi Gary:
Thank you for the prompt and informative response. I appreciate that.

I have done more research and testing with an infrared temperature sensor/readout and have determined that the source of the heat is the two (2) 50K 50W resistors which are inline when the amp is in the SSB mode (2500V).
The resistors get very hot (120 degrees C) even when the amp is in standby mode and the SSB switch is "on".
The transformer plates themselves are much cooler - about 30 C.

So, I will go through my junk box and install a fan or two on the PS just for insurance.

73, and tnx agn. Hope to meet you on the air.

Pat, VE3CNX

13546. Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-05 16:51:53 UTC
From: slowcountry1
Topic: 13108 Message: 13546

Garey,

This is where I am currently;

Regarding T-14 and the associated wiring; yes, I have looked at the CD and its evident that the wiring around this area is completely different. My unit is different than the one shown in the picture; 3 section cap instead of 4 and several other noticeable differences. I did not want to muck around in the area of T-14 and start changing things until someone verified that all TR-4's TR-4Cw rigs were the same in this area. If they are the same, I can wire it using one of my TR-4Cw rigs as a 'road map'. Someone changed out R-76 and the shielded cable that, on my TR-4Cw's that connect to it inside the carrier oscillator partition, the shielded cable is outside the partition on the opposite end of the resistor. T-15 has been molested but I did not want to remove it yet as its difficult to get at. From Pin 7 of V15 there is a mica cap that goes to board 9 and then to ground and some other changes. I'm leary of changing things here as I have no clue what they were trying to accomplish.

Yesterday, I changed out T-1. I have now replaced all of the cans that relate to 10 meters. This did not make any change on the S-Meter during alignment. I aligned the rig as best I could. Now, I put this TR-4 side by side with my TR-4Cw on similar antennas. I now hear weak signals on the TR-4 and some of them are stronger on the TR-4 than my unmolested TR-4Cw. The S-meter readings on the TR-4 are the same or an S-Unit higher depending on the signal.

Here are the problems that I have found;

1. After replacing the burnt resistors surrounding the S-meter circuit, on receive the S-Meter has a significant delay. It rises slowly to match the signal strength and then when the signal is gone it slowly goes back to S1.

2. For the first time, I transmitted on the air yesterday. I transmitted on all bands, 80 - 10 and received good audio reports. I noticed that the S-Meter does not kick upscale with voice peaks as it does on my TR-4Cw to indicate AGC activity. I swapped out the 12AX7 but no change.

3. I have an underlying and highly annoying what appears to be an AC hum from the speaker. I have no clue where the source of this is. I tried the headphone jack and have it there as well.

4. L6 and L7 on my TR-4 are air wound, no slug. L7 has been molested, split in two and spread apart. I pulled the slug tuned L6 and L7 from my parts rig and installed them. I tuned them per the TR-4C manual however; I was only able to obtain 40 watt on transmit. I then hand wound a new L7 and installed it. I was only able to obtain 65 watts on transmit. I then reinstalled the molested one and transmit at an even 100 watts. Is this coil actually supposed to be split and separated? I've changed out just about every thing adjustable in this chain.

Transmit into a dummy load produces;

28.8 110Watts
28.4 130watts
21.35 100watts
14.3 140watts
7.3 195watts
3.8 200watts

The unit is neutralized on 10M and all bands appear to produce max power at plate dip.

The calibration signal does not appear to produce the signal strength that It should on 10M and 15M but it appears that when hooked to an antenna the rig receives as good or a tad better than my TR-4Cw does. I do not know how the AGC is supposed to work but it seems to me that there might be something wrong with the AGC on transmit and receive?

It would be nice if the S-meter functioned as it should but If it cannot be fixed I can live without it. I have a feeling it points to other problems though. The background hum, while my brain tunes it out after an hour or so, really needs to go. Remember that I installed the TR-4 audio board out of my parts rig. This hum was not present, to the best of my recollection until the S-Meter related resistors burnt. All grounds have been checked and double checked as well as the chassis screws.

I am going to upload a couple of pictures of the R-76 area if you want to look at them.

Regards,

Doug N9XTF

I have compared it to a couple TR-4Cw parts rigs and the wiring in this area is quite different. I cannot find a picture on the internet, showing the area, with a serial number close to mine to verify that this was not the original configuration. Is there anything in this area that would effect 10 and 15M receive?
> >
> > I went through the S-Meter chain and was unable to find a short. I disconnected the meters, made sure the wiring was not shorted where they exit the mounting plate etc. I did not find any source for the problem however; I replaced R-71 with a flameproof 500 ohm 1/2 watt resistor and all seems to be fine in this area and now have the receiver working again. I have no clue here.

After sitting a parts rig next to my TR-4, we found that a mica cap (don't remember which number it is) was placed on the wrong leg to T-9. After moving it to the correct leg, on cal 15M produces S-9 and 10M now produces about S-4. We went back through all of the alignment and everything was pretty close. Section E, adjustment of Injection Couplers had to be done without the alignment load on 10M. When using the alignment load the S-meter has no deflection and cannot determine proper calibration. Any ideas here?

All of the voltages to TP were positive so I adjusted L1, L2 and L5; I was able to bring them down but only close to zero, could not obtain a negative voltage. I swapped out V1 with a used tube and got 40M to -.39VDC 15M to -.43VDC and 10M to -.42VDC. I did not have a new tube so today I replaced V1 with a new Amperex 6U8A tube that I had (I tried the tube from V3 it wasn't any better). I was then able to get 40M to -1.512VDC 15M to -1.482VDC and 10M to -1.34VDC. For smiles and grins, I replaced V3, assuming it was soft, with a new Amperex

6U8A tube. I have a bunch of these from a sale somewhere but I didn't have any 6EA8 new replacements.

From: Abqcooks@...
Topic: 13543 Message: 13547

For cooling fans on the top of the L4B itself I found what I think are ideal.
Google the Antec True Quiet 120
They are just the right size to sit over each of the 3-500s and are in fact super quiet. There's a dip switch to set for either 600 rpm or 1000 rpm. The 600 rpm setting moves plenty of air up out of the cabinet and makes almost zero noise. They have them at Amazon and Best Buy for 11 dollars....Staples for 15 dollars. Small price for what they do so quietly.
For the power supply I also found the cabinet to get pretty hot to the touch and so did like
Garey suggests with small nearly silent fans. The cabinet now stays cool to the touch. I power the fans with walworts plugged into the power strip that I use as a power switch to turn on the T4XC. Anyway, try the Antec fans....you wont even know they are on.

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

Hi Gary:
Thank you for the prompt and informative response. I appreciate that.

I have done more research and testing with an infrared temperature sensor/readout and have determined that the source of the heat is the two (2) 50K 50W resistors which are inline when the amp is in the SSB mode (2500V). The resistors get very hot (120 degrees C) even when the amp is in standby mode and the SSB switch is "on".
The transformer plates themselves are much cooler - about 30 C.

So, I will go through my junk box and install a fan or two on the PS just for insurance.

73, and tnx agn. Hope to meet you on the air.

Pat, VE3CNX

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

Patrick -

You can never have too much air on tube gear, unless it blows the tube(s) out of the socket(s). I think it was Bill Orr, W6SAI (SK),

who said that. If not it was one of his buddies at Eimac!

I run a 4" 'BOX' type fan just lying on top of the power supply,
blowing UP!. It doesn't have to be a turbine, just enough (silent) to
'encourage' that hot air to keep on rising, and get it away from the
area. I also put a fan on top of the L-4B,right over the tubes, same
type, blowing up, for the same reason. The PS and the amp right over
the tubeswill get too hot to comfortably hold your hand on. With the
fan(s) it's near room temperature.

Bottom line, both will work for a long time without the fans. Fans are
cheap, especially 220 or 24V fans on 120 or 12V, so why wouldn't
youuse them?

73, Garey - K4OAH

slowcountry1 wrote:
> Garey,
>
> This is where I am currently;
>
> Regarding T-14 and the associated wiring; yes, I have looked at the CD and its evident that the wiring around this area is completely different. My unit is different than the one shown in the picture; 3 section cap instead of 4 and several other noticeable differences. I did not want to muck around in the area of T-14 and start changing things until someone verified that all TR-4's TR-4Cw rigs were the same in this area. If they are the same, I can wire it using one of my TR-4Cw rigs as a 'road map'. Someone changed out R-76 and the shielded cable that, on my TR-4Cw's that connect to it inside the carrier oscillator partition, the shielded cable is outside the partition on the opposite end of the resistor. T-15 has been molested but I did not want to remove it yet as its difficult to get at. From Pin 7 of V15 there is a mica cap that goes to board 9 and then to ground and some other changes. I'm leary of changing things here as I have no clue what they were trying to accomplish.

I have no idea what someone was doing messing around in this area. The basic circuit and arrangement haven't changed since the first TR-4, and perhaps even the TR-3! :-)

>
> Yesterday, I changed out T-1. I have now replaced all of the cans that relate to 10 meters. This did not make any change on the S-Meter during alignment. I aligned the rig as best I could. Now, I put this TR-4 side by side with my TR-4Cw on similar antennas. I now hear weak signals on the TR-4 and some of them are stronger on the TR-4 than my unmolested TR-4Cw. The S-meter readings on the TR-4 are the same or an S-Unit higher depending on the signal.
>
> Here are the problems that I have found;
>
> 1. After replacing the burnt resistors surrounding the S-meter circuit, on receive the S-Meter has a significant delay. It rises slowly to match the signal strength and then when the signal is gone it slowly goes back to S1.

Make sure R163 is 100 ohms, may have increased due to overloading.
Make sure R62 is 33k ohms.

2. For the first time, I transmitted on the air yesterday. I transmitted on all bands, 80 - 10 and received good audio reports. I noticed that the S-Meter does not kick upscale with voice peaks as it does on my TR-4Cw to indicate AGC activity. I swapped out the 12AX7 but no change.

May be related to the slow response of the S-Meter, i.e., the just can't respond fast enough to show.

3. I have an underlying and highly annoying what appears to be an AC hum from the speaker. I have no clue where the source of this is. I tried the headphone jack and have it there as well.

Recheck wiring and grounding of the preamp stage. Sounds like you may have a ground loop.

4. L6 and L7 on my TR-4 are air wound, no slug. L7 has been molested, split in two and spread apart. I pulled the slug tuned L6 and L7 from my parts rig and installed them. I tuned them per the TR-4C manual however; I was only able to obtain 40 watt on transmit. I then hand wound a new L7 and installed it. I was only able to obtain 65 watts on transmit. I then reinstalled the molested one and transmit at an even 100 watts. Is this coil actually supposed to be split and separated? I've changed out just about every thing adjustable in this chain.

L6 and L7 are to allow peaking in the upper segment of 10M. They are essentially just a little more inductance on 10M as opposed to 10U for T8 and T10, respectively. In production, the Mixer and RF stages were peaked at 28.8 MHz, then switch to 10M and 28.3 MHz and adjust L6 and L7 for maximum. Sometimes that 10M adjustment frequency has to be shifted a little one way or the other to result in fairly flat output from 28 to 29 MHz.

Transmit into a dummy load produces; 28.8 110Watts 28.4 130watts 21.35 100watts 14.3 140watts 7.3 195watts 3.8 200watts The unit is neutralized on 10M and all bands appear to produce max power at plate dip.

Your output readings indicate soft PA tubes. Normal output is 200W on 80, 40 and 20M, 175W on 15M and 150W on 10M.

The calibration signal does not appear to produce the signal strength that It should on 10M and 15M but it appears that when hooked to an antenna the rig receives as good or a tad better than my TR-4Cw does.

Sounds more like a Calibrator problem than a receiver one. Try a 12BZ6 in V5.

I do not know how the AGC is supposed to work but it seems to me that there might be something wrong with the AGC on transmit and receive? It would be nice if the S-meter functioned as it should but If it cannot be fixed I can live without it. I have a feeling it points to other problems though.

The S-Meter (indicating AVC action) should kick up quickly, and then drop slowly when the signal stops. Check the voltages around V13a, which is the AVC amp. Again, I think the problem is more related to the meter than to the AVC circuitry. Does the receiver sound like the AVC is working correctly, e.g., little or no distortion on strong signals?

The background hum, while my brain tunes it out after an hour or so, really needs to go. Remember that I installed the TR-4 audio board out of my parts rig. This hum was not present, to the best of my

recollection until the S-Meter related resistors burnt. All grounds have been checked and double checked as well as the chassis screws.

Make sure the B+ for the Preamp stage is coming from the correct +150V supply.

I am going to upload a couple of pictures of the R-76 area if you want to look at them.

I have no idea what he was trying to do in there. Looks almost like he was trying to get the DSB signal out of the BAL MOD and take it to another mixer?? All I can recommend is doing your best to duplicate what the schematic and other references show.

Regarding only the S meter. On my TR-4 both meters
bounce a lot, makes tuning difficult. Perhaps something has
been put across the meter to stop its bouncing, a large
capacitor perhaps, that would explain its slow response and
lack of response to speech peaks.
I am reminded of the radical modifications of WW-2
vintage equipment in some of the ham magazines. Mostly they
don't do anything useful. Someone evidently decided to
second guess Drake's designers.

fred spake unto us the following wisdom:
> anyone have any ideas how to make a strain relief for the mike cord .

I have used several methods, but the easiest is a simple friction relief made out of a rubber grommet. If you use a typical mic cord of somewhere in the neighborhood of 3/16" diameter, and slip a regular 1/4" disc grommet over it before mounting, then the grommet will have to deform to fit in the U-shaped cutout of the S230. When you screw the metal plate down, it will press the grommet tightly against the cable and grip it securely.

You can get a pack containing suitable grommets for just a few dollars at Radio Shack:

http://www.radioshack.com/product/index.jsp?productId=2103392

This depends on the fact that the mic cord is somewhat loose in the S230 before mounting.

I have also had luck using a commercial mic cord removed from a hand mic, and carefully carving the strain relief to fit the S230. This yields a more professional-looking result, but I'm not sure it protects the cable substantially better than the simple grommet.

Ethan

Depending upon what type of relief you want, but the hardware store will often yield a nice coil spring that will slip over the cable, you'll just have to be creative on fastening it to the connector. Think D-104 base.

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

For cooling fans on the top of the L4B itself I found what I think are ideal.
Google the Antec True Quiet 120
They are just the right size to sit over each of the 3-500s and are in fact super quiet. There's a dip switch to set for either 600 rpm or 1000 rpm. The 600 rpm setting moves plenty of air up out of the cabinet and makes almost zero noise. They have them at Amazon and Best Buy for 11 dollars....Staples for 15 dollars. Small price for what they do so quietly.
For the power supply I also found the cabinet to get pretty hot to the touch and so did like
Garey suggests with small nearly silent fans. The cabinet now stays cool to the touch. I power the fans with walworts plugged into the power strip that I use as a power switch to turn on the T4XC. Anyway, try the Antec fans....you wont even know they are on.

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

Hi Gary:
Thank you for the prompt and informative response. I appreciate that.

I have done more research and testing with an infrared temperature sensor/readout and have determined that the source of the heat is the two (2) 50K 50W resistors which are inline when the amp is in the SSB mode (2500V). The resistors get very hot (120 degrees C) even when the amp is in standby mode and the SSB switch is "on".
The transformer plates themselves are much cooler - about 30 C.

So, I will go through my junk box and install a fan or two on the PS just for insurance.

73, and tnx agn. Hope to meet you on the air.

Pat, VE3CNX

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

Patrick -

You can never have too much air on tube gear, unless it blows the
tube(s) out of the socket(s). I think it was Bill Orr, W6SAI (SK),
who said that. If not it was one of his buddies at Eimac!

I run a 4" 'BOX' type fan just lying on top of the power supply,
blowing UP!. It doesn't have to be a turbine, just enough (silent) to
'encourage' that hot air to keep on rising, and get it away from the
area. I also put a fan on top of the L-4B,right over the tubes, same
type, blowing up, for the same reason. The PS and the amp right over
the tubeswill get too hot to comfortably hold your hand on. With the
fan(s) it's near room temperature.

Bottom line, both will work for a long time without the fans. Fans are
cheap, especially 220 or 24V fans on 120 or 12V, so why wouldn't
youuse them?

Is this the same cat that eats your homework?
Most TRS connectors I've seen have some form of strain relief or cord holder built-in. The old telephone co and military connectors have a recessed area just in front of the ring the cord enters by. I flat strap fits into it and is crimped onto the the cord. Some cords also have a thikened area, made by folding the cloth covering over and pulling it back that threads into the entrance ring. So much for military and telco practice. The standard sort of plug has a couple of wings at the cord entry which are meant to fold over and be crimped. This works fairly well. It takes a strong pull to rip the cord out. Some right angle plugs do not have any sort of strain relief. Some have enough clearance to put a tie wrap inside. On these a grommet under compression will help.

Thanks for the reminder , I knew I had seen those but did not remember where , will look and see if I have any old telephone cords . The S230 is a right angle type and has no strain relief . it's the same cat that keeps the FT950 full of hair .

Rich -

Have you considered something like the N3ZI (or one of a dozen or so
others,) in a box with a gain module and a homebrew attenuator?

If I was closer, you could borrow my HP606, it's 'compact'.!

The Heath IG-42 is a nice small generator and can be calibrated quite
well. The IG-102 is ok, but needs a separate counter. Any of these
need an external step attenuator for accurate level measurements

Andy -

Sorry, I don't have a CD for the the SPR-4.

I DO have a high quality scan of the manual and schematic. I've reworked the schematic so it can be blown up to 3' x 4' on a large format printer, if you have a business center of some sort. Or of course it can be blown up on screen and partial sections enlarged for printing on 8.5 x 11 paper.

Themanual has drawings of the pc boards with parts identified, and of course can also be blown up on the computer

Garey,

I removed R163 and R62 and they checked within tolerance. For smiles and grins, I checked R-55 it was 9.6K, I replaced it with 8.2K and R-51 was 10.4K, I replaced it with 8.2K. I checked these, even though they weren't in the circuit because they were close to R-71 that had burnt and I wanted to see if they had gotten hot and changed value.

My schematic stops at R162 so I did not find it on the drawing. The S-Meter is still very sluggish, takes a second or two to climb, even when adjusting the zero POT. I'm not finding anything else suspicious. There is an old 20uF electrolytic connected to C145A that goes over to a terminal (appears to be user added) and from that terminal to Board 2 at R163. I do not see this on the schematic. If I remove it and connect the wire directly to C145A the S-Meter rests at low scale and the zero pot has no effect, it will not move upscale.

Replacing V5 with a 12BZ6 took care of the low S meter readings on 10,15 and 20M. I now have S9+10 or so. Again, I have to wait for the S-Meter to climb.

Strong signals are not distorted at all on receive. I checked the voltages, on receive, of V13.

1. -.24VDC
2. -55.87VDC
3. -54.16
4.
5.
6. -1.29VDC
7. -55.7VDC Note DIMM kills receive when connected here
8. -52.3VDC
9. 6.14VAC

I have not found the source of the hum yet and have not had the time to dedicate to replacing and rewiring T-14. This is going to be a tedious, time consuming job.

Thanks,

Doug N9XTF

shown in the picture; 3 section cap instead of 4 and several other noticeable differences. I did not want to muck around in the area of T-14 and start changing things until someone verified that all TR-4's TR-4Cw rigs were the same in this area. If they are the same, I can wire it using one of my TR-4Cw rigs as a 'road map'. Someone changed out R-76 and the shielded cable that, on my TR-4Cw's that connect to it inside the carrier oscillator partition, the shielded cable is outside the partition on the opposite end of the resistor. T-15 has been molested but I did not want to remove it yet as its difficult to get at. From Pin 7 of V15 there is a mica cap that goes to board 9 and then to ground and some other changes. I'm leary of changing things here as I have no clue what they were trying to accomplish.

Doug -

I'm working from schematic 27000, in the Versions directory on the CD. I believe this is the correct schematic as the DUT s/n is 273xx?

R163, R168 and R71 all come together on the + lead of C145D. + DC voltage bus, should be +250 VDC or so.

R70and the + meter terminal come together on the lead to the output transformer and plate of V17.

R71 and the -meter terminal come together with R53, R76 and the secondary of T13.

This compares the plate current of V17 to that of V11 and V15. The bridge is balanced by way of the ZERO control with no input.

In receive, AVC is applied to the Grids of V11 and V12, reducing the current drawn by V11and causing the meter to increase. The more signal, the more AVC, less current by V11, higher meter reading.

In transmit, ALC voltage is applied to the Grid of V15, reducing the current drawn and increasing the meter reading.

Unless the meter itself is sluggish, (possible, it's NOT a quality movement,) one of the devices above is the culprit. Connect a test meter across the S-Meter and see if the voltage across it is coming up slowly or quickly!

Subject: [DrakeRadio] Re: TR-4 Repair

If you have not already check the meter itself by
disconnecting it and putting an ohm meter across it with a
fairly large resistor to limit the current. See what the
response it. I can't figure out why the meter itself would
be slow but its well to eliminate everything.
A scope is the best tool to find the hum.
Also, if you have Garrey's disc have the schematic
printed out large. Any office supply place can do this.
18x24 is not to large. Then trace out the meter circuit with
a colored pencil or highlighter. I find many schematics are
convoluted and confusing and my eye tends to lose track of
long traces that wind around. You may also have to redraw
some parts of the schematic to clarify what is actually
there.

Garey,

The rig serial number is 26095, I'm using schematic 26000. I'm not great at reading the schematics but have been trying to trace the circuit out. I have C145A, B and C; the three section cap not the 4 section in the later models.

The S-Meter was very "bouncy" until frying the related resistors.

I will put my voltmeter across the S-Meter and see what the voltage does.

I apologize for all of the stupid questions, some or most of this is above my head. Trying to learn as I go. Frustration had gotten the better of me and was going to send it off for repair but no one wants to touch it because of the modifications by the previous owners. I suspect a repair shop would cost well more than the rig's worth. I'
ve spent weeks just repairing screwed up mods and poor mechanical workmanship.

Thanks,

Doug N9XTF

OK. Well look at 27000. The only difference at this point is that there is no R163/C145D decoupling network, rest of the circuit is the same. That tacked on electrolytic you spotted may be an 'update', by the last guy in there.

You can use the ohmmeter function of your DMM to check the movement. Ohmmeter current is so low in DMMs you can measure direct.

I was afraid of that. Repair guys don't want modified units, since as you have found, you can spend hours trying to UNDO what some CB'er thought was a good idea..... The customer isn't going to want to pay for all those hours either! :-)

On the other hand, it's a great learning experience, with the added benefit that if you give up and part it out (absolute last resort) you can still get your money out of it.

Keep plugging, you'll get there!

From: radiomanL
Topic: 13553 Message: 13577

I think I got the problem solved . cut the crimp tab off of an extra 5 pin DIN plug shell and soldered it to the ground plate of the S230 . not pretty but should work and you don't see the inside anyway .

My apologies, I'm a CPA in real life and I got so caught up in tax season that I fell off the radio hunting wagon and I did not follow up on my TR-7 quest. If you have a very nice TR-7 and/or R-7 that needs to find a new home please contact me. I am looking and interested in setting up a TR-7 station this summer.

Thanks and kindest regards,

Tom

Hey, Garey -

I'd like to have a scan of the schematic for my SPR-4, too.
Do you charge for that? If so, no problem - your other CD's have been very valuable to me, and I'd like to be able to have a larger schematic for my SPR-4.

Subject: Re: [DrakeRadio] CD-For SPR4 REpairs & Maintenance

Andy -

Sorry, I don't have a CD for the the SPR-4.

I DO have a high quality scan of the manual and schematic. I've reworked the schematic so it can be blown up to 3' x 4' on a large format printer, if you have a business center of some sort. Or of course it can be blown up on screen and partial sections enlarged for printing on 8.5 x 11 paper.

Themanual has drawings of the pc boards with parts identified, and of course can also be blown up on the computer

13581. Re: TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-06 21:18:00 UTC
From: slowcountry1
Topic: 13108 Message: 13581

Garey and Steve,

Well its confirmed, my head is up the preverbal butt! Once again, I did not employ the tried and true KISS method. DIMM was bouncing around with voltage changes but S-meter was not. I pulled the meter, gently shook it and the needle did not move like they always do. I opened it up and somehow the vertical needle between the C cup appears to be "sticky". Didn't take time to futz with it but replaced it with one out of the junker. It now operates as expected once again. I have no clue how it worked and then got sticky. I'll let it run for a day or two and then I'll remove the extra electrolytic and see what happens there.

My TR-4Cw plate meter was like it was on a rubber band and I had to replace it to get it to calm down. Would have never guessed that they could also stick.

Last trick is the carrier balance re-wire. I will attempt it this weekend, that's going to be a real hassle. Once all is working well, then I've got to undertake a cleanup. I don't know where this thing was stored, but the chassis has all kinds of crud on it.

Thanks for all the help guys!!!

Doug - N9XTF

Woulda been quicker and easier to super glue the mic to the desk. ((*>*))

Den

I was so depressed last night thinking about the economy, wars, jobs, my savings, Social Security, retirement funds, etc., I called the Suicide Hotline. I got a call center in Pakistan, and when I told them I was suicidal, they got all excited, and asked if I could drive a truck.

Congrats on the find, Doug!

If it's that cruddy, when you're ready, take the meter and tubes back out and put the rig in the sink or tub. You shouldn't submerge, but some good, surfacting cleaner and a variety of brushes will clean it up. Rinse with plain water, then pour a jug of distilled water over it. Finish it up with an air gun at about 50 psi and a thorough dry (I use a 170 oven and turn it off as soon as it hits 170 - leaving the light on to contribute a little heat).

I'm gonna catch h-e-double-hockeysticks for the above, but this works for me and I've cleaned many, many rigs using this method.

Have fun!

Steve Wedge, W1ES/4

I checked these, even though they weren't in the circuit because they were close to R-71 that had burnt and I wanted to see if they had gotten hot and changed value.
> >>>
> >>> My schematic stops at R162 so I did not find it on the drawing. The S-Meter is still very sluggish, takes a second or two to climb, even when adjusting the zero POT. I'm not finding anything else suspicious. There is an old 20uF electrolytic connected to C145A that goes over to a terminal (appears to be user added) and from that terminal to Board 2 at R163. I do not see this on the schematic. If I remove it and connect the wire directly to C145A the S-Meter rests at low scale and the zero pot has no effect, it will not move upscale.

My unit is different than the one shown in the picture; 3 section cap instead of 4 and several other noticeable differences. I did not want to muck around in the area of T-14 and start changing things until someone verified that all TR-4's TR-4Cw rigs were the same in this area. If they are the same, I can wire it using one of my TR-4Cw rigs as a 'road map'. Someone changed out R-76 and the shielded cable that, on my TR-4Cw's that connect to it inside the carrier oscillator partition, the shielded cable is outside the partition on the opposite end of the resistor. T-15 has been molested but I did not want to remove it yet as its difficult to get at. From Pin 7 of V15 there is a mica cap that goes to board 9 and then to ground and some other changes. I'm leary of changing things here as I have no clue what they were trying to accomplish.

>>I apologize for all of the stupid questions, some or most of this is above my head. Trying to learn as I go. Frustration had gotten the better of me and was going to send it off for repair but no one wants to touch it because of the modifications by the previous owners. I suspect a repair shop would cost well more than the rig's worth. I'
ve spent weeks just repairing screwed up mods and poor mechanical workmanship.

There are no "stupid" questions! The stupid thing is to not ask questions when there's help around!

You are bringing back to life a thoroughly abused piece of history and that's noble.

I assume you have another HF radio to talk on, so you're not completely dependant on the TR-4.

So take the pressure off of yourself. You are learning SO much in the process. And think of when it'll be done.

Remember that it's a hobby. And "amateur": means "for the love of it".

I think the meter got fried along with the resistor. If
you dissect it you will probably find the insulation on the
coil has been cooked and expanded causing the meter to
stick. Probably not repairable.

13587. Re: [DrakeRadio] Drake L4B power supply temperature

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-07 00:48:28 UTC
From: Patrick Ross
Topic: 13543 Message: 13587

I have tested two small muffin fans atop the L4PS - 12V dc.
Temperature of bleeder resistors reduced from 135C to 30C!

Thank you all for your timely and helpful assistance. Much appreciated.

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

For cooling fans on the top of the L4B itself I found what I think are ideal.
Google the Antec True Quiet 120
They are just the right size to sit over each of the 3-500s and are in fact super quiet. There's a dip switch to set for either 600 rpm or 1000 rpm. The 600 rpm setting moves plenty of air up out of the cabinet and makes almost zero noise. They have them at Amazon and Best Buy for 11 dollars....Staples for 15 dollars. Small price for what they do so quietly.
For the power supply I also found the cabinet to get pretty hot to the touch and so did like
Garey suggests with small nearly silent fans. The cabinet now stays cool to the touch.
I power the fans with walworts plugged into the power strip that I use as a power switch to turn on the T4XC. Anyway, try the Antec fans....you wont even know they are on.

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

Hi Gary:
Thank you for the prompt and informative response. I appreciate that.

I have done more research and testing with an infrared temperature sensor/readout and have determined that the source of the heat is the two (2) 50K 50W resistors which are inline when the amp is in the SSB mode (2500V).
The resistors get very hot (120 degrees C) even when the amp is in standby mode and the SSB switch is "on".
The transformer plates themselves are much cooler - about 30 C.

So, I will go through my junk box and install a fan or two on the PS just for insurance.

73, and tnx agn. Hope to meet you on the air.

Pat, VE3CNX

Patrick -

You can never have too much air on tube gear, unless it blows the tube(s) out of the socket(s). I think it was Bill Orr, W6SAI (SK), who said that. If not it was one of his buddies at Eimac!

I run a 4" 'BOX' type fan just lying on top of the power supply, blowing UP!. It doesn't have to be a turbine, just enough (silent) to 'encourage' that hot air to keep on rising, and get it away from the area. I also put a fan on top of the L-4B,right over the tubes, same type, blowing up, for the same reason. The PS and the amp right over the tubeswill get too hot to comfortably hold your hand on. With the fan(s) it's near room temperature.

Bottom line, both will work for a long time without the fans. Fans are cheap, especially 220 or 24V fans on 120 or 12V, so why wouldn't youuse them?

From: Garey Barrell
Topic: 13108 Message: 13591

Doug -

Are you making plans for all the projects you're going to have time
for now!?!?!?

I agree with Richard, thought the same thing. Eitherboiled the enamel
off the wire causing mechanical interference, shorted turns (most
likely,) or just roughed up the bearing (current goes through it) to
cause it to stick. Drake paid a little over $1 for those meters, so
give it a decent burial!

> Well its confirmed, my head is up the preverbal butt! Once again, I did not employ the tried and true KISS method. DIMM was bouncing around with voltage changes but S-meter was not. I pulled the meter, gently shook it and the needle did not move like they always do. I opened it up and somehow the vertical needle between the C cup appears to be "sticky". Didn't take time to futz with it but replaced it with one out of the junker. It now operates as expected once again. I have no clue how it worked and then got sticky. I'll let it run for a day or two and then I'll remove the extra electrolytic and see what happens there.

My unit is different than the one shown in the picture; 3 section cap instead of 4 and several other noticeable differences. I did not want to muck around in the area of T-14 and start changing things until someone verified that all TR-4's TR-4Cw rigs were the same in this area. If they are the same, I can wire it using one of my TR-4Cw rigs as a 'road map'. Someone changed out R-76 and the shielded cable that, on my TR-4Cw's that connect to it inside the carrier oscillator partition, the shielded cable is outside the partition on the opposite end of the resistor. T-15 has been molested but I did not want to remove it yet as its difficult to get at. From Pin 7 of V15 there is a mica cap that goes to board 9 and then to ground and some other changes. I'm leary of changing things here as I have no clue what they were trying to accomplish.

13593. RE: [DrakeRadio] Drake L4B power supply temperature

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-07 02:50:36 UTC
From: Greg Schultz Sr
Topic: 13543 Message: 13593

I have the L7 amp and the PS has the same arrangement to create bias. Mine shorted to ground and took out a couple of diodes. I rebuilt the PS putting in a new rectifier board and caps from Harbach and eliminated those resistors. I now generate bias with a 50v zener diode inside the amp itself. Those resistors are a disaster waiting to happen.

Subject: Re: [DrakeRadio] Drake L4B power supply temperature

Hi Gary:
Thank you for the prompt and informative response. I appreciate that.

I have done more research and testing with an infrared temperature sensor/readout and have determined that the source of the heat is the two (2) 50K 50W resistors which are inline when the amp is in the SSB mode (2500V).
The resistors get very hot (120 degrees C) even when the amp is in standby mode and the SSB switch is "on".
The transformer plates themselves are much cooler - about 30 C.

So, I will go through my junk box and install a fan or two on the PS just for insurance.

73, and tnx agn. Hope to meet you on the air.

Pat, VE3CNX

Patrick -

You can never have too much air on tube gear, unless it blows the tube(s) out of the socket(s). I think it was Bill Orr, W6SAI (SK), who said that. If not it was one of his buddies at Eimac!

I run a 4" 'BOX' type fan just lying on top of the power supply, blowing UP!. It doesn't have to be a turbine, just enough (silent) to 'encourage' that hot air to keep on rising, and get it away from the area. I also put a fan on top of the L-4B,right over the tubes, same type, blowing up, for the same reason. The PS and the amp right over the tubeswill get too hot to comfortably hold your hand on. With the fan(s) it's near room temperature.

Bottom line, both will work for a long time without the fans. Fans are
cheap, especially 220 or 24V fans on 120 or 12V, so why wouldn't
youuse them?

Hi Guys,

I just spotted this ad on the Ontario Swap Shop web site, which might interest the few just-plain-Jane R-4 receiver owners that are out there...!

Please note: the usual dis-claimers apply.

~73~ de Eddy VE3CUI - VE3XZ

Gaetan VE3AZQ [613-212-1365] in cornwall ON has listed the following (05-05-2013 14:25:33):

For Sale (last updated 05-05-2013, listed 04-04-2013)
Manufacturer: DRAKE
Model: R 4
Drake R4 receiver Parts.
Tubes set 30.00 free shipping
Transfo 30.00 free shipping
Meter 25.00 free shipping
Many other parts avalaible.

Topic: 13108 Message: 13596

What is the resistance supposed to be as measured across the movement? If the windings aren't shot, I'd like to try to make it work; I don't have another spare for future projects and I'm sure these are unobtanium.

I still have work to do to the unit, ie T-14 rewire, troubleshoot hum and cleanup however; I might actually get some radio time now. Or it would be nice to think so.

checked R-55 it was 9.6K, I replaced it with 8.2K and R-51 was 10.4K, I replaced it with
8.2K. I checked these, even though they weren't in the circuit because they were close to
R-71 that had burnt and I wanted to see if they had gotten hot and changed value.
> >>>>>
> >>>>> My schematic stops at R162 so I did not find it on the drawing. The S-Meter is

still very sluggish, takes a second or two to climb, even when adjusting the zero POT. I'm not finding anything else suspicious. There is an old 20uF electrolytic connected to C145A that goes over to a terminal (appears to be user added) and from that terminal to Board 2 at R163. I do not see this on the schematic. If I remove it and connect the wire directly to C145A the S-Meter rests at low scale and the zero pot has no effect, it will not move upscale.
> >>>>>

My unit is different than the one shown in the picture; 3 section cap instead of 4 and several other noticeable differences. I did not want to muck around in the area of T-14 and start changing things until someone verified that all TR-4's TR-4Cw rigs were the same in this area. If they are the same, I can wire it using one of my TR-4Cw rigs as a 'road map'. Someone changed out R-76 and the shielded cable that, on my TR-4Cw's that connect to it inside the carrier oscillator partition, the shielded cable is outside the partition on the opposite end of the resistor. T-15 has been molested but I did not want to remove it yet as its difficult to get at. From Pin 7 of V15 there is a mica cap that goes to board 9 and then to ground and some other changes. I'm leary of changing things here as I have no clue what they were trying to accomplish.

13597. Group E-mail response

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-07 16:34:24 UTC
From: slowcountry1
Topic: 13597 Message: 13597

All,

I see that it appears that some respond directly to the group via e-mail. I tried to respond to a post via my e-mail client however; it does not show up on the group. Is this as simple as "Reply" in the e-mail client or is there some other procedure for doing this?

Thanks,

Doug N9XTF

13598. Transmitter loading when changing frequencies

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-07 16:43:54 UTC
From: slowcountry1
Topic: 13598 Message: 13598

I'm sure this has been covered many many times however; I have a question regarding changing frequencies (within the same band) and transmitter tuning.

Its obvious that it will depend on the band, SWR changes over a given frequency range etc; is there a rule of thumb how far one can change frequency before the rig needs to be retuned?

I always completely retune the rig when I make a frequency change; I'm sure this is unnecessary stress on the tubes etc. Should one just re-dip the plate and touch up the load cap if necessary or what's the best procedure to follow?

Thanks,

Doug - N9XTF

I just hit "Reply" and the email comes up addressed to the group.
If I hit "Reply All" the email comes up addressed to the group and a CC:
is sent to the original poster.

I'm using Thunderbird, FWIW.

My antennas are all pretty flat (SWR-wise; not flat on the ground) and
I'm not terribly finicky. So, if I move 10 or 20 KHz I don't always
retune. If I move much further I will re-dip the plate and maybe touch
up the pre-selector on the receiver.

OTOH, if I do move and plan to stay for a while (long winded rag chew)
then I re-dip even if the move was small.

Oh, and when I say "re-dip" what I really mean is that I re-peak the
power output using the Plate control. I find that procedure to be more
accurate than looking for a broad dip. It's usually not much of a change..

Been running the same finals for all of this century and a good portion
of the last..

Doug -

Not sure what you're asking......

Most email clients "REPLY" to the sender, which in this case sends
only to the list. "REPLY ALL" in 'some' clients will reply to the
list and to any other Send To addresses.

An email to me from the list shows the originators email in the 'From'
field, and DrakeRadio in the 'Reply-to' field.

It sounds like your client shows the originator in the Reply-to field.

What is your client? Perhaps someone using the same can answer
better.......

ANY R4 receiver will transceive with the T-4XC. For proper transceive,
you'll have to dothe Transceive Align procedure from the T-4XC manual.

Doug -

All you have to do is 'dip the plate' ANY time you move overa few kHz. You can NEVER harm anything by dipping the plate!!! It IS frequency dependent, the low bands allow very few kHz before re-dipping, and upper bands allow more. Generally if the plate current increases when you move, it needs to be re-dipped. If you're dithering around chasing a DX station in a pile-up, it's not a big deal, since we're talking transmissions of a fewseconds at most.

Rule #1- Dipping the plateshould ALWAYS be the first and last thing you do any time you tune the transmitter.

I use Outlook 2007 and the mail client on my Iphone. If I click reply all, on either client, it puts the original contact (Gary Barrel) in the To field and ...Yahoo groups in the CC field. If I send the email from either, it does not show up on the group.

From what I read here, this should work. I will have to investigate why it is not forwarded to the group. I always have to login to the group and post from the web. It can get quite tedious surfing though long postings.

Thanks,

Doug N9XTF

13607. Re: [DrakeRadio] Transmitter loading when changing frequencies

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-07 17:42:21 UTC
From: Mark Pilant
Topic: 13598 Message: 13607

Hi Garey.

> Generally if the plate current increases when you move,
> it needs to be re-dipped.

This bring up a question I've had for a while but never asked.
Which will show how little I've used hollow state transmitters.
(Although I've been playing around with electronics long
enough to remember when the CK-722 was the hot new thing :-)

Anyway...

When I use my TR-3 or TR-4 to transmit, I usually tune up into
a dummy load to get the Plate and Load settings close. For me,
this works because my antenna has a pretty flat SWR across the
bands I use.

So my question is should I be adjusting the Plate and Load
controls once I start transmitting on the antenna instead of the
dummy load?

Thanks in advance.

13609. Re: [DrakeRadio] Transmitter loading when changing frequencies

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-07 18:06:32 UTC
From: Garey Barrell
Topic: 13598 Message: 13609

Mark -

Absolutely! IF boththe dummy and antenna were exactly 50 ohms and j0,
no change would benecessary. BUT, it just ain't that way. :-)

BOTH units vary 'slightly' from perfect, and tuning and loading are
'matching' the transmitter output stage to that _impedance_.
Impedance is resistance that is frequency dependent.

The advantage of a dummy load is primarily tilted toward your
neighbors! A dummy load is also a good testing device, since unless
it's been damaged, it's relatively unchanged over a fairly wide
frequency range. An antenna however, is ONLY 'perfect' at ONE
frequency. Either side of 'perfect' the SWR increases slightly at
first and more rapidly as you move further from it's 'resonant' frequency.

So initial tune-up into a dummy load protects your Ham neighbors while
you TUNE and LOAD and PEAK and DIP, etc. until you get it right. IF
your antenna is truly matched at that frequency, switching to the
antenna should only require a very slight adjustment to the PLATE
control for dip. The better the antenna match, the smaller the PLATE
controlmovement. I would expect 'some' adjustment, however slight,
between any dummy load and any antenna.

Again, the first and LAST thing you do is dip the PLATE.!

If it were my meter I would try to repair it. Since it responds at all it appears to be a mechanical problem not electrical. The coil is not open. I don't know how to get these meters open, someone else here may know. If you can get it open you may be able to see what has happened. If there is anything loose in the gap try blowing it out using a hand syrenge rather than canned air, you don't want too much pressure. Even just blowing with your mouth may work. If that frees it up your home. If the insulation on the wire has boiled and expanded it may be more difficult but you may be able to free it by using some very fine sandpaper in the gap to sand off just enough to get clearance. I doubt if its a bearing but it may by that the meter got slammed so hard that it knocked a bearing loose. If so you will be able to see it and probably be able push the pin back where it belongs, I am very doubtful this is the problem but should be looked for. Small particles of anything but particularly magnetic material can be removed from the gap with Scotch tape.
I have had some success with repairing meters. It takes a delicate touch and one must be very careful not to do additional damage such as bending pointers. It is certainly worth a try.
Depending on your eyesight a couple of pairs of drugstore reading glasses of various strengths may be helpful or one of those goose neck illuminated magnifiers. It also helpful to have some non-magnetic fine tweezers.

Richard,

I opened it up. It's the same as the plate meter I tried to repair. The coil is dark and has a burnt smell to it. It measures like 180 ohm or something. I forget exactly what I measured. I have a feeling the sticky is between the vertical pin and the C cup. I can push the pointer to the right and it ever so slowly returns. I didn't see any obstruction elsewhere. Again, this was a quick inspection.

Without know what the resistance is supposed to be, I'm almost afraid to make it work and then fry the circuit in another rig if and when I need it.

It appears that you are using the Yahoo Groups web
application to read and respond to the list. You can access
it using e-mail but have to enter the necessary information
at Yahoo to have it send that way. Go to:
http://groups.yahoo.com/group/DrakeRadio/join

and change whatever setting you need to have the list sent
to you via e-mail.

I suggest setting up a folder and filter in your e-mail
client to keep all messages from the list together. The
DrakeRadio in brackets in the subject header works well as a
filter criteria.
Different e-mail clients respond differently to the
reply buttons plus different lists may be set up
differently. In this list when I click on reply or reply
all I send only to the list and must cut and paste a second
address. In other lists the "reply" button goes to the
original sender and one must hit reply-all to go to the
list. I think this is bad practice because many valuable
posts never get to the bulk of list members or to the
archive. This is beside the point. Once you have set Yahoo
to send the list via e-mail you can still read it on the web
sit if you choose.

The TR-4 meter is 200 ohms. Either a 3 or 5 mA full scale.

Its possible it has a shorted turn but I think more
likely it just overheated. I don't think the meter could be
the cause of the resistor burning out even if it was a dead
short. A shorted turn would make it read wrong and might
damp it slightly but what you have is mechanical I think.
See if alcohol affects the plastic case and if it does not
try spraying some dry alcohol into the bearing to see if it
frees up.

Sounds like the coil might be OK but a more careful
measurement should be made. If its normally 200 ohms and he
is really getting 180 the coil may have some shorted turns.
Not surprising if the insulation is burned.

13616. Tube cooling, what does a fan really do?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-07 21:22:07 UTC
From: Richard Knoppow
Topic: 13616 Message: 13616

In the course of putting together a new fan for my T4XB
I began to wonder about what purpose the fan really serves.
It is the popular wisdom that the fan extends tube life.
From my understanding of how tubes work this is not the
case. Tubes have a hard vacuum inside. A vacuum does not
conduct heat. The proof is the Dewar flask AKA thermos
bottle which works by having a double walled container with
a vacuum inside. The heating of the envelope of the tube is
by radiation from the plate, there is no conduction within
the tube. So, cooling the envelope of an internal anode
tube has little, if any, effect on the plate temperature.
The reason for forced air cooling of larger tubes is to keep
the envelope and seals at the terminals cool. It is
certainly necessary for large tubes where the envelopes can
get hot enough to cause the seals to leak. Large tubes
sometimes develop holes in the envelopes due to hot spots
that soften the glass enough to permit it to be sucked in by
the vacuum but these hot spots are usually caused by
electron bombardment from very high voltages. Such voltages
do not exist for small transmitting tubes of the sort used
in lower powered Drake equipment or most other 100 to 200
watt range ham transmitters.
Plate temperature is extremely important since
excessive heating of some types of plate material can cause
them to outgas or even become distorted. The small tubes of
the sort called "sweep" tubes as widely used in equipment of
the period before solid state amplifier devices are not
designed to run at high plate temperatures as are some of
the larger internal anode tubes. Any color at all indicates
too much heat and may cause damage to the tube's
performance. Since external cooling affects only the
outside parts of the tube the only way to extend tube life
is to avoid excessive heating of the plate. That means
limiting plate dissipation pretty strictly. This is well
known but it should be understood that a fan of whatever
power will not change the dissipation limit of the tube.
Undoubtedly cooling the chassis around the final
amplifier will assist in prolonging other components that
are affected by heat and I don't suggest doing away with the
fans, but it should be understood that they have little if
any effect on tube life other than perhaps protecting the
seals, and certainly do not provide any additional margin
for overload.
Large internal anode tubes like the 4-1000A and others
depend on air cooling for the envelopes and seals, not to

cool the anodes. Some of these tubes, for instance the old 1000T require some air to be blown on the seals but do not rely on forced air for anode cooling.
Another place where cooling may be mis-understood is the use of IERC tube shields on small receiving tubes. These tubes are no different than the transmitting types, that is, keeping the envelopes cool may be good for the envelope but does nothing for the internal structure of the tube. IERC shields evidently _do_ cool the envelope where the common silver colored twist on shields probably increase the heat due to trapped air between the shield and envelope but claims that the tube life is increased IMO need some proving since about the only effect will be to perhaps cool the seals. But on miniature tubes the seals are all at the bottom on the press so head is conducted away by the tube pins and sockets.
Note that the above does not apply to _external_ anode tubes such as the 4CX1000A and even the very old 892 (water cooled) or 892R (air cooled, the R means radiator). The outside of the anode is directly exposed in these tubes and the air flow has a very definite effect on the anode temperature.

Richard -

Interesting discussion, but empirical results disagree..... One, I HAVE seen 6JB6 tubes with a hole 'sucked' in the side of the bulb. BIAS failure, oversize fuse in the power supply.

ANY heat radiated by the envelope has to reduce the temperature of the glass, which is conducting, however poorly, heat away from the plate. Likewise, any heat blown away from the glass and the immediate area has also got to reduce the heat of the entire system. Glass is NOT a perfect insulator nor an infinite heat block.

Certainly air moved away from the PA cage will extend the life of associated components.

Bottom line is that without a small fan, the top of the T-4X(any) transmitters quickly become too hot to hold your hand on. A small, silent fan will bring it to room temperature. Almost all that heat comes from the PA tubes, whether from conduction, radiation or ...

Maybe we have someone here who recalls more of thermodynamics classes than I do. (Wouldn't take much!)

If the glass envelope got hot enough to be sucked in on a sweep tube, the plate was glowing red hot and has already been weakened. Or destroyed. Think CB sweep tube amp.

I agree air cooling will not lower the anode temp of this type of tube in any major way, if at all. The cooler the better for pretty much everything else in there though. My fans are stayin' put.

Regards,
Chris

Granted its a much larger tube, but the 3-400 and 3-500 tubes are forced cooled in the L4 and the L4B cooling the seals and anode. Other manufacturers use direct cooling with a single fan. Are they more concerned about anode temperature here?

Hi Garey,

Having done well in my "Heat Transfer in Electrical Engineering" class as part of my BSEE course work, I can refresh your memory. The three methods of heat transfer are conduction, convection, and radiation.

Conduction occurs when two objects of differing temperatures are in physcial contact. Heat transfer occurs by electrons gaining energy.

Convection occurs when a fluid passes over the surface of an object at a different temperature. Air is considered a fluid. Heat transfer occurs by electrons gaining energy. A fan is a form of convection cooling.

Radiation heat transfer is by electromagnetic waves, mainly IR for most objects we would be concerned with.

Richard is correct in that the primary method of heat transfer from an internal anode is by radiation. There is of course some heat transfer from the anode to the glass by means of connecting wires and tube pins, etc.

The glass is not thermally transparent to the IR and will absorb some of the radiated heat from the anode, perhaps a significant amount. The glass in turn will also radiate heat in all directions, radiating some of the energy back towards the plate. I suspect that convection cooling of the glass by a fan will reduce the amount of heat radiated back towards the anode by reducing the temperature of the glass. That may result in the anode temperature being less than it otherwise might be.

73,

Bill

From: David Winfree
Topic: 13616 Message: 13621

The heating of the envelope of the tube is
by radiation from the plate, there is no conduction within
the tube. *Agreed. * So, cooling the envelope of an internal anode
tube has little, if any, effect on the plate temperature. *HMMM, requires
more thought here. *

The fact that the glass does, if fact, heat up proves that it acts as an
insulator, however poor. Now that we have established the fact that at
least SOME insulation is occurring, proves that the glass does impede heat
transfer. That further suggests that cooling the glass envelope by moving
air provides less resistance to heat flow, out of the anode. More to the
point, a cooler glass allows more heat transfer at a given anode temp.
That shows that the anode temperature would in fact drop as the glass temp
drops. Now, is it a one to one effect? I think we can show it won't be
any MORE than a one to one drop, but I'm inclined to think the anode drop
is closer to the glass temp drop.

I saw a sweep tube from a CB linear once, years ago, that had the glass sucked in against the side of the plate structure. IIRC, the vacuum actually held, but the tube wasn't working very well regrdless. It was a Varmint XL-1000, or something like that. The term "linear" as highly optimistic with those things.

It seems to be conventional wisdom in some circles that 3-500, etc., require some color in the plate to activate the gettering material coating the plate structure. I've seen pictures of tubes of this sort in broadcast service glowing orange. So I would imagine that envelope and seal cooling are of high importance.

Chris -

No doubt the tubes were already destroyed, BUT, they were still
drawing current and probably got close to white hot before the glass
sucked in.

ON those tubes, the biggest concern is the glass/metal seals where the
pins and cap go through the envelope. The glass is hard, high
temperature glass, but coefficient of expansion is different, andthe
seals will leak if they get too hot.

Bill -

Thanks, I can accept that, there was a glimmer of recognition or two
in there!! :-)

Just getting the heated air out of the area seems to do the most good.
'Natural' convection is good, but if we can help that fluid along in
it's travels over the glass(and metal) surfaces, it can only help to
reduce the temperature of everything involved. Obviouslyfans blowing
OUT or UP 'help' convection rather than hinder it. The same moving
air also helps cool the black metal surfaces surrounding the tubes,
reducing the amount of heat available to reflect BACK into the tubes.

I think I'll stick with Bill Orr, 'As long as it doesn't blow the
tubes out of their sockets ...'

13627. Drake TR-M

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-08 03:21:13 UTC
From: Byron
Topic: 12772 Message: 13627

Hello-Anyone here ever play around with the Drake TR-M Marine Band unit? I picked up some of them out of an old marine-services facility. I do not intend to use them as-is, I have been studying the manual and am thinking about using the main board, driver board, some of the bandpass filters and the osc's to put together a low power SSB transceiver. Not sure if I would care to keep any of the A3A or A3H circuitry/features. Would need to provide tuned circuits for receiver front end and a pre-mixed VFO. Or, the main board would make a nice receiver with suitable front end tuned circuits and VFO, esp with the AM bandwidth feature of crystal filter and diode detector. Just some thoughts, thanks for your time.
73's, Byron

"... a cooler glass allows more heat transfer at a given anode temp. That shows that the anode temperature would in fact drop as the glass temp drops. Now, is it a one to one effect? I think we can show it won't be any MORE than a one to one drop, but I'm inclined to think the anode drop is closer to the glass temp drop...."

Radiated heat transfer from a given source does not depend on the temperature of other objects. However every object that does absorb the radiated heat will itself, re-radiate some of that heat. A cooler glass will result in a lower anode temperature because the GLASS will not re-radiate as much heat back towards the anode. The same should hold for other objects in the rig as well.

Its very unlikely that a change in temperature of the glass will result in the same change in temperature of the anode. The change in temperature due to an increase or decrease in heat depends on the amount of heat transfered, the mass of the material ,and it specifiy heat capacity (a property of the material itself).

Subject: Re: [DrakeRadio] Tube cooling, what does a fan really do?

The heating of the envelope of the tube is
by radiation from the plate, there is no conduction within
the tube. *Agreed. * So, cooling the envelope of an internal anode
tube has little, if any, effect on the plate temperature. *HMMM, requires
more thought here. *

The fact that the glass does, if fact, heat up proves that it acts as an insulator, however poor. Now that we have established the fact that at least SOME insulation is occurring, proves that the glass does impede heat transfer. That further suggests that cooling the glass envelope by moving air provides less resistance to heat flow, out of the anode. More to the point, a cooler glass allows more heat transfer at a given anode temp. That shows that the anode temperature would in fact drop as the glass temp drops. Now, is it a one to one effect? I think we can show it won't be any MORE than a one to one drop, but I'm inclined to think the anode drop is closer to the glass temp drop.

13629. Tube cooling, what does a fan really do?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-08 14:19:40 UTC
From: John Sehring
Topic: 13616 Message: 13629

When it comes to heat, let's not forget the "Ten Degree C" rule:

For every 10 degrees C increase in operating temperature, every thermally driven chemical process goes twice as fast, i.e. its rate of aging doubles. (The inverse is true for every 10 degree C reduction in temperature.)

It's also known as the "Arrhenius rule". It's a good widely used rule of thumb in many, even critical, industries & environments. For example the U.S. Nuclear Regulatory Commission accepts it as well as the military.

This gives us practical answers for parts made from organic materials, e.g. plastics, rubber, synthetics, and other non-metallics, which age quickly.

None of my boatanchor equipment has a top cover on it. I run my T-4B (no, that's not a mis-type) without the final tube cage: 1) It's then cooler and 2) my 6GJ5's fit (they are taller than 6JB6s). Yes, I must watch the HV present there!

Some gear has a bottom cover on but only if that doesn't create heat concentrations. My R-4B PTO stabilizes faster, too, without a top cover.

Been running exclusively tube-type ham gear here since 1975; no SS stuff on the air from this shack! Includes two Drake Twins, Collins S-Line, Halli SX-101A, Hammarlund HX-50A, all tubes.

I have little doubt that keeping my olde stuff cool has contributed a lot to its longevity.

I don't prefer fans as an awful lot of junque is picked up by them. Look at the interior of the average fan-cooled PC, kerchoo! Grease & dust pushed into the T/R relay? No thanks.

As far as air cooling final (sweep) tubes go, unless the glass envelope melts, I doubt there's much need for it. Running them under *proper* (rated) circuit conditions will never get you to that point.

Its interesting that you mention the "Arrhenius rule". I've worked for semiconductor companies for 30+ years. When I statrted in the late 1970's digital chips were typically designed to have a minimum lifetime of 20 years if operated continuously at their max data sheet temperature spec and within all other datasheet limits. The question then becomes how can you say they will last for 20 years without actually operating them for 20 years? Enter the "Arrhenius rule". Using this rule, experts in semiconductor reliabilty were able to come up with standard accelerated life tests. Often these stress tests involve subjecting the parts to temperatures much higher that the max datasheet temperature for hundreds of hours.

Its my understanding that a lot of the semiconductor reliability methods commonly used were originally driven by the military.

Topic: 13631 Message: 13631

It looks like I've got a bad 923 in the calibrator of an R-4B. I seem to recall someone on this list having some for sale.

Anyone have a couple I can buy?

Cheers -

Steve Wedge, W1ES/4
Sent from my iPhone: PSE excuse any autocorrect faux pas :)

Yes Steve, I had asked the group and also researched the RTL IC and found that it is the same as an NTE 9923. If you can find a place that has the NTE replacement line, they should have one. I have a local shop here in Kalamazoo, MI (Ken's 2 way radio [and CB] shop). If you don't find it anywhere, let me know and I can contact Ken and have him send you one.

Steve,

It appears to be a UL923 RTL J-K flip flop.

try this:
http://semiconductormuseum.com/MuseumStore/MuseumStore_Fairchild_923_Index.htm

The schematics that I can see online are too fuzzy. Is the xtal at 100kHz? If not, what freq is the cal xtal?

Bill

Thanks, Ski.

I only had a little time to dig in tonight, but found that I have one rather anemic pulse train coming out of the first one and nothing at all out the second. The jumper is where it should be and the signal level out the buffer should have more than enough amplitude to do the job.

A previous owner had been messing about with the calibrator and he may have fried the IC's. There's a little over 4V at Vcc on the calibrator board.

It has been a wicked long time since I've seen RTL but I'm guessing the supply voltages are similar to TTL.

Output on IC1.5 was about 1V but it was a decent square-wave.

Steve,

I have a few, and if you get into trouble, I'll share. Last time I offered any, Garey or one of the others gave a link that had them "cheap as dirt", so I withdrew my offer to sell some. I likely have a lifetime supply, with the few I bought years ago, but they were something like $5 or less on the site given. I'm fighting learning Windoze 8 right now on a laptop, so I'm computer disadvantaged right now, HI.

Can't seem to find a straightforward datasheet for this. The Internet used to be useful but now everybody wants to give you a bloody quote before they let you see the Wizard.

Am I correct in assuming Vcc should be around 4 to 5 volts, or is 4V too low? I know with TTL, 4V would be too low.

The previous owner did some messing about with this circuit - probably in an attempt to fix it. It appears that this whole board runs off the filament supply, through a half-wave rectifier and through a 180 ohm resistor. I'm measuring the voltage at Q5 collector at about 4.5V. The buffer has plenty of output, though the waveshape is "soft" and the transistor is definitely saturating.

Output of IC1 is very low, but is there as a square-wave.

The 923's are probably good. They typically run on 3-6V, and a logic HIGH is about 3.5V MAX. If you are seeing an output, they're probably alright.

We used those in the Apollo computer in 61 or 62. I built a nice little electronic keyer with some!! :-)

The crystal is 100 kHz, standard HC-13/u. Each F-F divides by two, resultingin 25 kHz output. As I recall, and 1 on aninput is a volt or better. Fairly narrow 'window', which was only one of their many problems!!!

Steve,

Per Garey the two 923's form a divide by four circuit. If you can't find a pair of 923's it would be pretty simple to wire in a pair of CMOS D-type f/f to do the same divide by 4 function. The CD4013 is a dual f/f and works with a supply from 3V to 18V. You could put one on a tiny piece of perfboard and use small guage wire to attach it to the 923 connections.

73,

Bill

Topic: 13631 Message: 13644

Cool. Yeah, that's why I'm trying to find a real datasheet. I know that RTL is different but I never really worked on it.

The second IC now has intermittent output and the levels are from about a normal TTL L of 0.6 to a H around 1.9V. Vcc is a little over 4V.

I can now hear something on the receiver when the calibrator is turned on. It takes 5 -10 seconds for the output to come up from IC2 but the oscillator starts immediately.

I may have to remove this board and get it on the bench.

Steve.

I you can't get it ti work or if anyone else in the list has a dead one I'd like to borrow it.

Like to get the dimensions of the board and mounting holes as I have been thinking of making a pcb that contains the calibrator I designed for qst a while back.

100/25 kHz with pulsed output (can be turned off)

Surface mount parts will be used.

There is also the CD4027 dual JK flipflop.

Steve -

Yes, there is a data sheet of sorts on the site given earlier. I believe the'design' voltage is 3.6V, but it much more 'flexible' than TTL. The power dissipated, which is high, is directly related to Vcc. I don't remember any capacitors being involved, just Resistor-Transistor Logic. 1961 is just about right, that's when I started with NASA. :-)

Most likely a bad C190. If you checked the 'R-4B Semiconductor Voltages' chart on the CD, you'd see you should have about 3.9 VDC on the 923's.!! :-)

Yes, these are both viable substitutions. I don't know just how many
923's this guy has, but he has been selling them for YEARS from that
website!! :-)

I guess I'm just too much a purist, but as long as the original parts
are available, within reason, I'd rather keep these radios original.

From: Mark Pilant
Topic: 13631 Message: 13652

Hi Steve.

Another possibility. I do have an old Motorola data book with RTL logic chips listed (not many :-). So far I haven't been able to find a cross reference. If I could get one, I could certainly scan the appropriate pages if there.

BTW, I face data for:
MC913 Type D flip flop
MC702, 802, 902 R-S flip flop
MC723, 816, 916 J-K flip flop
MC774, 874, 974 J-K flip flop
MC790, 791, 890, 891, 990, 991 Dual J-K- flip flop

In general, Vcc is 3.0VDC for MC800F & MC900 series, and 3.6VDC for the MC700 and MC800P series. Max Vcc is 4.0VDC.

Maybe this will help.

There weren't a whole lot of different chips. There were several types of gates, and as I recall, the NOR function was particularly hard to implement. Biggest problem was heat, not very efficient technology! :-)

Most any single or dual flip-flop will work as a divide-by-four. D, J-K, R-S allrelate to programming different division integers and are immaterial for a fixed, simple divider.

Steve -

Amazing what's stored in the memory cells when you sweep out the
dust!!! :-)

Input is a B-E junction, 0.5 definitely LOW, 1.0V definitely HIGH

Output is a saturated transistor, 0.2 LOW, 3.0V (Vcc) HIGH

Maximum FANOUT is ~20, but practical design limited it to 5.

The 1969 Motorola Semiconductor Data Book only mentions fan out and dissipation. The 1965 Motorola Semiconductor Data Manual is much more limited in the devices listed, but does have a couple of the voltages listed.

Neither input or output low voltages or output low voltages are listed. Only output high is listed, and is 620mV @ -55C, 300mV @ 25C, and 230mV @ 125C. However, looking at the timing diagrams, which do not reference temperature, the high voltage is in excess of 500mV; so it is probably 620mV. These are references to a "low" which would seem to be 0V.

Caveat here, these voltages are for Motorola's mWRTL series not the normal RTL series. I know I have references in my library, but finding them would probably take quite a while :-(Although a web search might turn up typical H/L voltages for RTL logic. (Or someone else may have some old data books laying around :-)

I hope this helps.

Input is a transistor Base, so 0 input is anything below that turn-on,
typically around 0.6V.

Output is Vcc of a cut-off transistor, less resistance to limit
current when output transistor is saturated. Number of Loads equal
how many B-E junctions can be turned on through that resistance.

Keep in mind these were very crude devices compared to later TTL.

Cool. It appears I probably have good IC's. I'll have to look at the post-output network. The tone in the receiver is raspy and off-frequency and doesn't appear to change when I adjust the trimmer cap.

The worst-case scenario is I bypass the IC's and use it for 100 kHz.

I guess you're not seeing my comments....

Have you changed C190 yet?

The input is a B-E junction, so a '0' input is anything up to a
silicon junction or ~600 mV.

An input '1' is anything above about 0.87 mV which is apparently
enough to turn on most junctions, and 1V is used as a 'guaranteed' '1'.

An output '0' is a C-E junction at saturation, usually 2-300 mV in the
era.

An output '1' is a C-E junction at 'open', typically 3.6V, but
resistor limited by max saturation current, and therefor the fanout is
theoretically however many B-E junctions it can turn on in parallel.
We used five as a guideline, but it could be 'stretched' a bit if
necessary!

Mike -

All Drake documentation that I have shows the RF Amp as a 12BZ6. The 12BA6 is the IF Amp.

Somewhere around s/n 1000, the RF Amp was changed to a 6BZ6.This and several other changes undocumented by Drake are shown in the Revised schematic in my CD for the 2-C/2-NT.

No, I haven't changed C190 yet.

Once upon a time, I had a full selection of analog components at my disposal, which I could change on a heartbeat.

I moved from MA to NC and at that time, I sold off all my parts. Thus, if I have to change out anything, I have to look locally to my buddies first, then to my friend in NH who got most of my goodies, then I go to Mouser.

I am suspecting the components on the output. I know for a fact that the PO pulled the whole board out to try and figure out what was wrong. There are a couple of hacks that will have to be straightened out but they're not at issue right now. They look sloppy but are connected.

Mike,

Get to the underside of the chassis and measure the voltage at the filament pins. If it's 6 volts, then replace with a 6BA6....if 12 volts, then replace with a 12BA6.
Garey may have a bit of insight on this also as I recall he had some messages a while back on this subject. Got to the Yahoo groups page, find the Drake Radio group, sign in and go to messages...and then search for 12BA6 - 6BA6 and read what comes up.

Have fun, let us know what you find.

From: KA5DWI
Topic: 13670 Message: 13670

Hi all,
I need some help. There is something I am missing somewhere, but can't seem to recall how to fix it.

When I hook up a straight key to my TR3, I am setting a carrier out when the key is not depressed. It builds up over time and gets worse. Let's say on 40 watts out key down, the carrier is about 10 watts. On a 100 watts it has been as bad as 60 out.

The TR3 is a lousy CW rig, but would like to play with it on "boat anchor" activities.

I am not sure if the same problem exists if I hook up my electronic keyer.

Thanks. I appreciate any advice.

Art -

More information!!

Does it occur with NO key plugged in?? If ONLY when a key is plugged in, does the key have a capacitor across it's terminals? The keying circuit is high impedance, it doesn't take much leakage to key it.

First, make SURE your BIAS supply in the AC-3 isn't failing.... You should see a stable -60 or so volts on the buss. Complete failure of this supply dueto leaky filter capacitors or bad diodes, can cause catastrophic failure (destruction!) of the TR-3 and AC-3. Do NOT leave the transceiver ON and unattended (even in standby) until that supply is stable.

Could be a gassy V4 or V6.

Terry -

Yeah, it's all fixed. Replaced all the Pass transistors (three checked BAD, one OK) and the Driver transistor(Good, but Low Beta). Fired it up and only three Pass transistors got warm under full load! Turns out the 0.18 ohm, 15W current sense resistor was about 1.5k!. Never seen one just go up in value, always either right or open.

OF course, there's no such thing as a 0.18 ohm, 15W resistor any more. Only thing close was 0.18 ohm, 10W from NTE (non-stocked at Mouser, Digi-Key, Allied, etc., of course). Dissipates about 8W at full load, but that offends my inner-engineer. Found some of those on eBay, so bought some.NTE has a line of 25W resistors, BUT lowest one made is 'ta-da!' 0.2 ohms. Finally decided to go with a pair of 0.36 ohm, 10W NTEs, special ordered from Newark. No extra charges, except for direct drop ship from NTE, about $5. So ordered eight of those ($0.44 each) and had them four days later.

So piggy-backed one on another and managed to get them in there with my Drive-by soldering technique. I brought a tremor home from my last hospital escapade, so soldering is kinda get the iron near the joint, get the solder in the general area, and wait for them to run into each otherand the joint at the same time!! The originals had their leads through the mounting eyelet in the terminal strip, so thank goodness for the Hakko! Couple of blips, and the original fell out.

It's been cooking on the bench with the TR-7 for the last few days. Replaced the 500 Hz filter that's been dead for a while and did an alignment there. Two-tone test looks great, 130W output on all but 10M (110W). I ordered some thick-film resistors at 0.62 ohms to use as degenerative feedback on the PA Driver stage, but I haven't been able to get it to 'run-away' thermally as some have mentioned, its little heat sink isn't very warm, so guess I'll leave that for the next time! I have a spare PA here, and I may stick one onthere and see what happens on the bench.

Ultimate test, heard a W7 in AZ on 15M SSB in a QSO, and while he was talking to the other station I did a mad search for a microphone! Finally found one in the storage room, plugged it in and gave him a call when he signed. Came right back! Didn't talk long, he was shutting down, but I bet he had a better antenna than my attic mounted 40' dipole!! :-)

I guess I ought to post to the group, since I'm always harping on others to do so..... thanks for asking!!

Hi Garey,

Picked up a TR-4 "parts rig" at an electronics flea market this morning (also got an MS-4 and an AC-3 in the deal). The PTO shaft has a lot of vertical play and some horiz play. Is it hosed or is this play adjustable/ repairable?

73,

Bill

FB, Garey! Glad to hear it. I sympathize with you about the tremor. It's VERY difficult for me to get a good solder joint anymore. Either the solder, the iron or the component jiggle too much, and I usually end up with a crystalized joint. I've got a nice R4B that won't work anymore due to that - I may have to send it to the guy in Portland, OR sooner or later.

Terry -

Yeah, it's all fixed. Replaced all the Pass transistors (three checked BAD, one OK) and the Driver transistor(Good, but Low Beta). Fired it up and only three Pass transistors got warm under full load! Turns out the 0.18 ohm, 15W current sense resistor was about 1.5k!. Never seen one just go up in value, always either right or open.

OF course, there's no such thing as a 0.18 ohm, 15W resistor any more. Only thing close was 0.18 ohm, 10W from NTE (non-stocked at Mouser, Digi-Key, Allied, etc., of course). Dissipates about 8W at full load, but that offends my inner-engineer. Found some of those on eBay, so bought some.NTE has a line of 25W resistors, BUT lowest one made is 'ta-da!' 0.2 ohms. Finally decided to go with a pair of 0.36 ohm, 10W NTEs, special ordered from Newark. No extra charges, except for direct drop ship from NTE, about $5. So ordered eight of those ($0.44 each) and had them four days later.

So piggy-backed one on another and managed to get them in there with my Drive-by soldering technique. I brought a tremor home from my last hospital escapade, so soldering is kinda get the iron near the joint, get the solder in the general area, and wait for them to run into each otherand the joint at the same time!! 13676. Drake R-4B S#7676B Dead PTO/VFO

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-11 20:47:01 UTC
From: cavemaaaan
Topic: 13676 Message: 13676

Hey Guys :)

I just bought this repair special R-4B last week with a dead PTO/VFO. I have the +11vdc going into the PTO but I don't get any signal on my o-scope out of it on the white/green wire coming out of it. I removed the PTO from the radio and have removed the cover. I don't see any obvious bad solder joints or anything else suspect yet.

Before I proceed any further, I'm asking the experts for their experiences with a dead PTO. I can extend the three wires and run it outside of the radio for testing purposes.

Has anyone had the MPF102 FET go bad? The 1N714 diode? The 2N3858 transistor?

I read one old post where a silver mica cap went bad...which one? Another where the white tubular cap went bad....

everything else seems okay so far on this radio so I'm stuck at the dead PTO

If anyone's interested, I have taken some pics of the internals of the PTO.

Thanks guys,
Dan Gibbs
KD8SSS
Swartz Creek, MI

Brass tab from tuning coil to pcb got me one time. Cracked solder joint.
Pretty common I hear.

Bill -

There is a hole in the back wall of the 'gearbox' to access an Allen setscrew. There is a clearance hole in the back end of 'some' covers, but if you've not been inside it's risky to go that way. Best to remove the cover so you can see!

Hopefully some gorilla hasn't broken the coil form loose!!!!

Tighten the setscrew only enough to take out any side to side play in the MAIN TUNING shaft. If the set screw has been loosened TOO much, the single ballbetween the end of the shaft and the screw. The balls in the front can also fall out if too loose.

There should be 10 balls, 1/8" dia steel (ACE or True Value) balls in the front race, and one at the back endof the shaft.

Dan -

The simple answer is 'YES'. ALL of those failures have been seen over the years. If you can't hear the PTO on a separate receiver, (assuming you don't have a scope,) [000 on the dial is 5.455 MHz], then most likely the FET. Better replacement for the MPF 102 is a 2N5950. The '102 is a 'floor sweeping' with very wide specifications. The 2N3850 or 2N3563 are ok as buffers, a 2N3904 works well.

If the Zener shorts, you won't have +11V on the power terminal. Same for the bypass electrolytic/tantalum in some versions. Ihave documented at least 17 varieties of the PTO, so don't panic if yours isn't exactly like the schematic!

My experience goes like this.

1. Broken solder jointat coil tap.

2. Shorted Electrolytic/Tantalum if present

3. Shorted Zener

4. Dead FET

5. Dead Bipolar

6. Bad (intermittent/noisy) 3000 pF Dur Mica

7. Bad glass (white) TC cap. Avoid replacing this one as it is selected for TC.

Try to avoid moving 'flying' leads and components found in some PTOs as they 'may' affect linearity.

There is a lot more in the archives of the list, and a nice article on WB4HFN's site.

13681. Re: [DrakeRadio] 923 IC

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-11 21:33:10 UTC
From: Steve Wedge
Topic: 13631 Message: 13681

Well, the 923 seems to be working okay but this calibrator board has a lot of issues.

I changed C190 - no cure. Then it started working intermittently. Touched up some soldering. Found that the jumper was shorted to the crystal body. The oscillator that uses the FET is running about 30V p-p. The variable cap does not change the frequency. The crystal may be not original but looks the same and is marked 100 kc.

The 923 output is about 1V in amplitude.

Now the receiver also is generating a lot of random noise that goes away when I pull V5 and does not go away when I pull any other tubes, so I'll be probing around there.

Hey, it's a project! The receiver actually looks a little nice than the one that's currently my "station" receiver, so it may replace it once I get all the bugs ironed out.

Does anyone have a spare trimmer cap they'd like to sell me?

Steve -

Just remember ... 'We do this for fun ...' 'We do this for fun ...'
'We do this for ......'

I don't have a trimmer, but I have had good luck disassembling,
cleaning and reassembling them. There is a thin gasket that sticks.
In some cases, it seems 'stuck' and if you get a bigger hammer it may
break the silvering loose from the schematic. Sometimes just a shot of
DeoxIT will clean them up.

On the V5, check D10for leakage/breakdown.

So ordered eight of those ($0.44 each) and had them four days later.

So piggy-backed one on another and managed to get them in there with my Drive-by soldering technique. I brought a tremor home from my last hospital escapade, so soldering is kinda get the iron near the joint, get the solder in the general area, and wait for them to run into each otherand the joint at the same time!! The originals had their leads through the mounting eyelet in the terminal strip, so thank goodness for the Hakko! Couple of blips, and the original fell out.

It's been cooking on the bench with the TR-7 for the last few days. Replaced the 500 Hz filter that's been dead for a while and did an alignment there. Two-tone test looks great, 130W output on all but 10M (110W). I ordered some thick-film resistors at 0.62 ohms to use as degenerative feedback on the PA Driver stage, but I haven't been able to get it to 'run-away' thermally as some have mentioned, its little heat sink isn't very warm, so guess I'll leave that for the next time! I have a spare PA here, and I may stick one onthere and see what happens on the bench.

Ultimate test, heard a W7 in AZ on 15M SSB in a QSO, and while he was talking to the other station I did a mad search for a microphone! Finally found one in the storage room, plugged it in and gave him a call when he signed. Came right back! Didn't talk long, he was shutting down, but I bet he had a better antenna than my attic mounted

40' dipole!! :-)

I guess I ought to post to the group, since I'm always harping on
others to do so..... thanks for asking!!

Garry, excuse the premature send. Fat third finger.

Just wanted to let you know that reading the posts today I realized I really enjoy this list. Always knowledgeable, always fun. Really great list.

Keep it up!

Yeah, it's all fixed. Replaced all the Pass transistors (three checked BAD, one OK) and the Driver transistor(Good, but Low Beta). Fired it up and only three Pass transistors got warm under full load! Turns out the 0.18 ohm, 15W current sense resistor was about 1.5k!. Never seen one just go up in value, always either right or open.

OF course, there's no such thing as a 0.18 ohm, 15W resistor any more. Only thing close was 0.18 ohm, 10W from NTE (non-stocked at Mouser, Digi-Key, Allied, etc., of course). Dissipates about 8W at full load, but that offends my inner-engineer. Found some of those on eBay, so bought some.NTE has a line of 25W resistors, BUT lowest one made is 'ta-da!' 0.2 ohms. Finally decided to go with a pair of 0.36 ohm, 10W NTEs, special ordered from Newark. No extra charges, except for direct drop ship from NTE, about $5. So ordered eight of those ($0.44 each) and had them four days later.

So piggy-backed one on another and managed to get them in there with my Drive-by soldering technique. Garey,

Sounds like my PTO has no balls!
I'll try that when I get a chance.

thanks,

Bill

PS- I'm sure this is "covered" in your CD's?

Subject: Re: [DrakeRadio] TR-4 PTO

Bill -

There is a hole in the back wall of the 'gearbox' to access an Allen
setscrew. There is a clearance hole in the back end of 'some' covers,
but if you've not been inside it's risky to go that way. Best to
remove the cover so you can see!

Hopefully some gorilla hasn't broken the coil form loose!!!!

Tighten the setscrew only enough to take out any side to side play in
the MAIN TUNING shaft. If the set screw has been loosened TOO much,
the single ballbetween the end of the shaft and the screw. The balls
in the front can also fall out if too loose.

There should be 10 balls, 1/8" dia steel (ACE or True Value) balls in
the front race, and one at the back endof the shaft.

Steve -

Just remember ... 'We do this for fun ...' 'We do this for fun ...'
'We do this for ......'

I don't have a trimmer, but I have had good luck disassembling,
cleaning and reassembling them. There is a thin gasket that sticks.
In some cases, it seems 'stuck' and if you get a bigger hammer it may
break the silvering loose from the schematic. Sometimes just a shot of
DeoxIT will clean them up.

On the V5, check D10for leakage/breakdown.

Dan -

Just about any of the components can fail, but the problems can usually be attributed to one of the following 4 components:
* Zener diode 1N714
* Silicon diode 1N4148
* Transistor 2N5950, 2N3563
* Solder point on the PTO coil is broken.

Mark Gilger, WB0IQK has a Drake PTO Repair Refurbish article, with Photos.
Should be straight forward repair on the bench.

I did see that one, but it's too big. As I mentioned, the originals
are mounted between two terminal strip eyelets. The 10W that I have,
and the 15W in the Vishay style are both 1.875". The 20W Vishay is 2.5".

The parallel 0.36 ohm at 10W work fine, as there is room for 'height'
(even if is it 'sideways' height!) :-)

Thanks for looking.

13690. Re: Drake R-4B S#7676B Dead PTO/VFO

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-12 05:10:18 UTC
From: cavemaaaan
Topic: 13676 Message: 13690

Hey guys :)

Well I dug out my 40yr-old junkyard-find variable Kepco PS and applied +11vdc to the white/red wire, ground to the white/black wire, and hooked my Tektronix 2445 oscilloscope to the white/green wire. Nothin.

But then I carefully rapped on the edge of the PTO/VFO PCB with a screwdriver handle and it started to oscillate and turning the PTO/VFO knob varied the frequency which I read on my o-scope thanks to the built in cursor-driven freq counter.

The UNLOADED sine-wave output signal is running steady at 3.5VACp-p. When installed in the radio I think I read it should read approximately 1.8-2.0Vpp when o-scoped at coil L6 or at two of the contacts on the XTAL/VFO switch on the side of the radio. L6 is on the PCB directly behind the AF-GAIN control underneath the chassis.

At the low-end of the PTO/VFO dial, I have a beautiful-shaped sine wave on the display at 4.90MHz. Adjusting to the high end, I get 5.40Mhz. The high end will only adjust mechanically to 5.4MHz and not get to the 5.5MHz as stated on the PTO shield. The PTO will adjust down to 4.55MHz when I go past the dark-gray grease on the worm drive and that's as far as I'm willing to try to see how low it will go. The stated range on the PTO shield is 4.9MHz to 5.5MHz.

It has been running fine now for over 30 minutes on my bench. I am placing a 75-watt light-bulb in my worklight above it to try and simulate heat from the chassis to see if it konks out. I have the PTO/VFO mounted upside down in my Panavise - the PTO PCB is facing up and the bulb is roughly four inches away from the center of the PCB. It's been running this way for about five minutes or more - I just rapped on the edges of the PCB again and there was a slight flutter in the sinewave amplitude but it came right back to 3.5Vpp and is still steady. I'm gonna run it like this for a while and see what happens.

I may try and refresh the solder-connections on most to all of the traces on the PCB. I still don't know if there is just a bad solder joint that I can't see or if a capacitor or resistor is intermittent or not.

Sorry for the long-winded descriptions here but I hope that this may help the next guy out who's looking for some details in trying to figure his PTO/VFO out. My PTO has the MPF102, the 2N3858, and the 1N714 zener diode. There are no other diodes on my PCB.

Don't forget the main sm resonating capacitor - about 90 pf. I know mine was changing value intermittently, but I'm thinking it could fail entirely. Rare, but possible if replacing the fet doesn't fix it.

Dan -

Sounds good. I'd be willing to bet the solder joint on the coil tap
is cracked, at either end.

Your level sounds good, the frequency range is 4.955 to 5.455 MHz.
You might haveto slip the gears, (push left on the nylon gear shaft on
the left side of the gearbox,) and you can also slip the dial on the
hub for the final mm or two.

The diode didn't show up until the C-Line.

Sounds like you're well on your way.!

>
> But then I carefully rapped on the edge of the PTO/VFO PCB with a screwdriver handle and it started to oscillate and turning the PTO/VFO knob varied the frequency which I read on my o-scope thanks to the built in cursor-driven freq counter.
>
> The UNLOADED sine-wave output signal is running steady at 3.5VACp-p. When installed in the radio I think I read it should read approximately 1.8-2.0Vpp when o-scoped at coil L6 or at two of the contacts on the XTAL/VFO switch on the side of the radio. L6 is on the PCB directly behind the AF-GAIN control underneath the chassis.
>
> At the low-end of the PTO/VFO dial, I have a beautiful-shaped sine wave on the display at 4.90MHz. Adjusting to the high end, I get 5.40Mhz. The high end will only adjust mechanically to 5.4MHz and not get to the 5.5MHz as stated on the PTO shield. The PTO will adjust down to 4.55MHz when I go past the dark-gray grease on the worm drive and that's as far as I'm willing to try to see how low it will go. The stated range on the PTO shield is 4.9MHz to 5.5MHz.
>
> It has been running fine now for over 30 minutes on my bench. I am placing a 75-watt light-bulb in my worklight above it to try and simulate heat from the chassis to see if it konks out. I have the PTO/VFO mounted upside down in my Panavise - the PTO PCB is facing up

and the bulb is roughly four inches away from the center of the PCB. It's been running this way for about five minutes or more - I just rapped on the edges of the PCB again and there was a slight flutter in the sinewave amplitude but it came right back to 3.5Vpp and is still steady. I'm gonna run it like this for a while and see what happens.

True.

Remember, it may be two 45 pF caps rather than a single 90 pF.

Hi Guys,

The stability intermittent issue that I had with my T-4X PTO was ultimately & finally solved (touch wood!) by way of a "shot gun" approach, i.e. I replaced practically ALL of the PTO components---resistors included---save for the two transistors...

I found deteriorated solder joints with the main SM caps, and concluded that there were residual changes occurring in some resistor as the thing heated-up with use. So rather than expending the time that it might take looking carefully at each & every one, I simply replaced them all...

...And I have NEVER looked back!

~73~ de Eddy VE3CUI - VE3XZ

PS: I also found that installing a small cooling fan atop the rig---just above the final PA cage---reduced the overall drift of the rig by some 50%! A very worthwhile "mod", IMHO (my fan here EXTRACTS air OUT of the cage, rather than blowing fresh air INTO it).

From: GREGORY GENTILE
Topic: 13676 Message: 13695

Hi Garey,
Would you know the value of the screen choke in the grid circuit of the final of the TR-6. It is labeled RFC-12 on the schematic. Also where I might find a replacement?
Thank you,

Gregory Gentile

Gregory -

Sorry, I don't have any information on those chokes. It looks like
the one right next to it is the same, so may be able to measure that one.

It's not real critical, just to prevent RF from the PA section from
getting out on the power supply bus. It appears to be a solenoid
wound, single layer on a phenolic form. I would guess something in
the 4- 6 uHy range would be more than adequate. Something like the
Bourns 46xx type fromMouser (542-4609-RC) should work fine. 4 uHy is
about 1200 ohms at 50 MHz.

Again if you have the capability to measure the one next to it, that
would be best. Also, if you wanted to make accurate measurements
there are calculators on the net to calculate the inductance. The
thing you want to watch for is that the Self Resonant frequency is
well above the operating frequency. As the frequency increases, the
inductive reactance goes up, until self-resonance is reached. Above
that the capacitive reactance goes down as the frequency goes up.

13697. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-12 16:24:03 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 13697

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

13698. Re: Drake R-4B S#7676B Dead PTO/VFO

From: cavemaaaan
Topic: 13676 Message: 13698

Well I went through the PTO soldering all connections EXCEPT for the wire on the side of the tuning coil and the leg of the tubular white TC cap that attaches to a wire that flies to the vertical pcb - they were nice and tight and I saw no need to invite trouble. I found that there was a suspect solder-connection from the wire that goes from the ground trace on the horizontal PCB to the ground terminal on the vertical PCB. I could pry a lil with my ceramic tweaker and get the PTO to stop oscillating.

I also cleaned the mechanical "side" of the PTO and got all of the old dirt grease and oil out. Figured out how to put the gears all back together to get the end-stops working properly and within the 4.9 to 5.5MHz range.

I then put the PTO all back together, including the shield, and tested it BEFORE I put it back into the radio....solid as a rock and a range of 4.9MHz to 5.5MHz stop-to-stop on my o-scope. I put it back in the radio and am listening to it right now on 20m with my old Antron-99 10m antenna. Damn I still hafta get a wire up :)

Now, the next "beast" is to repair/replace the Preselector vernier (my T-4X needs a new one too for the RF Tune). Also, new capacitor kit ordered today from Hayseed Hamfest @ $40 delivered - The original caps are working with no noise, but this radio is only 5 months younger than me so...

Thanks Guys,
Dan Gibbs

Subject: [DrakeRadio] Re: Drake R-4B S#7676B Dead PTO/VFO

Well I went through the PTO soldering all connections EXCEPT for the wire on the side of the tuning coil and the leg of the tubular white TC cap that attaches to a wire that flies to the vertical pcb - they were nice and tight and I saw no need to invite trouble. I found that there was a suspect solder-connection from the wire that goes from the ground trace on the horizontal PCB to the ground terminal on the vertical PCB. I could pry a lil with my ceramic tweaker and get the PTO to stop oscillating.

I also cleaned the mechanical "side" of the PTO and got all of the old dirt grease and oil out. Figured out how to put the gears all back together to get the end-stops working properly and within the 4.9 to 5.5MHz range.

I then put the PTO all back together, including the shield, and tested it BEFORE I put it back into the radio....solid as a rock and a range of 4.9MHz to 5.5MHz stop-to-stop on my o-scope. I put it back in the radio and am listening to it right now on 20m with my old Antron-99 10m antenna. Damn I still hafta get a wire up :)

Now, the next "beast" is to repair/replace the Preselector vernier (my T-4X needs a new one too for the RF Tune). Also, new capacitor kit ordered today from Hayseed Hamfest @ $40 delivered - The original caps are working with no noise, but this radio is only 5 months younger than me so...

Thanks Guys,
Dan Gibbs

Andrew -

Yes, the values are not too critical, BUT they must all be the SAME.
Their primary function is to share the current equally among multiple
devices in parallel, inserting a little 'negative feedback' in the
regulation loop. IF one (or more) of a group of parallel transistors
tries to pass more current than the others, this resistance causes the
Emitter voltage to increase, reducing the Base current and thus the
total current through that device. So if you have four transistors,
as in the PS-7, each with a 0.18 ohm resistorin series with the
Emitter leads, the current will be equally divided among the four devices.

Of course any voltage dropped across these resistors is lost as heat,
and contributes to the power supply losses, so you want to keep them
as low as possible while still having enough effect on balance.

So, yes, I could have changed all four resistors to 0.2 ohms, but, the
25W resistors were too long for the mechanical arrangement. Since it
appears that no one is making 0.18 ohm, 15W resistors that are 0.875"
long any more, my parallel of two 0.36, 10W is the best that can be
accomplished! At least that's my story, and I'm sticking toit!! :-)

13702. Stand alone spectrum display

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-13 13:56:35 UTC
From: slowcountry1
Topic: 13702 Message: 13702

All,

I would like to add a stand alone band scope to monitor signals on the band that the rig is currently tuned to. I have seen some that are using an SDR radio. Does anyone do this with any of the Drake Transceivers and if so, what are some good options? I would like to do it without a PC but from what I've seen this may be impossible. I would like to also possibly monitor my transmitted signal if possible. This is not by any means a necessity for me but something I would like to have.

Thanks,

Doug - N9XTF

Doug -

I'm not sure I follow what you are looking for.

A 'separate' band monitor is easy, the 'Five Dash, Inc.' Ensemble II SDR receiver ~ $75 kit with case, is a great receiver, 0-30 MHz. It does require a PC though. You can view up to 90 kHz anywhere in the range. All signal processing is done at audio frequencies in the PC, all modes, IF bandwidths, detectors, AVC, audio, etc. If you just want to play, a 'single band' (160-20M) version is ~$20.

Some have taken a single band version tuned to the IF of a conventional radio as a band scope. This has limited value with today's radios, since all have some sort of 'roofing filter' very early in the circuit. For example, the 4 Line receivers have an 8 kHz wide filter right after the second mixer, making that the widest your band scope can cover. If you put it there, then all you are using of the conventional radio is the frequency conversion 'front end' to convert 0-30 MHz down to 5.645 MHz +/- 4 kHz. Not real useful.

???

Gregory -

Sorry, I don't have any information on those chokes. It looks like
the one right next to it is the same, so may be able to measure that one.

It's not real critical, just to prevent RF from the PA section from
getting out on the power supply bus. It appears to be a solenoid
wound, single layer on a phenolic form. I would guess something in
the 4- 6 uHy range would be more than adequate. Something like the
Bourns 46xx type fromMouser (542-4609-RC) should work fine. 4 uHy is
about 1200 ohms at 50 MHz.

Again if you have the capability to measure the one next to it, that
would be best. Also, if you wanted to make accurate measurements
there are calculators on the net to calculate the inductance. The
thing you want to watch for is that the Self Resonant frequency is
well above the operating frequency. As the frequency increases, the
inductive reactance goes up, until self-resonance is reached. Above
that the capacitive reactance goes down as the frequency goes up.

13705. Vacuum Tube Volt Meter VTVM versus Digital Multi Meter DMM

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-13 15:30:44 UTC
From: cavemaaaan
Topic: 13705 Message: 13705

Hello again all :)

In reading some older posts, I ran across a reply by Garey Barrell where he states:

"I just learned the other day, (after 50 years!,) that there are readings on that voltage chart that ONLY match IF you use a Vacuum Tube Volt Meter (VTVM) to make them. Serious differences, like from e.g., 1.4 VDC to 7.6 VDC."

By the time I got my electronics wings in the early nineties, the DMM or DVM was already king. I worked on some old tube guitar amps year ago whose schematics and service manuals talked of the "mysterious" VTVM but I was always able to repair without the need for one.

So, Garey got my wondering and I'm asking the Drake Sages here for the benefit of all for their thoughts on the differences between a VTVM and a modern quality DMM.

For what it's worth, I've used my Fluke 79 at work and at home for 20 years.

Cheers all,
Dan

Hey Doug :)

I love your question as I'm interested in doing the same thing myself WITH a PC-based SDR. I have a NooElec TV28T RTL2832U-based tuner ($20) fed with a RANVerter 2.2 upconverter ($35) feeding HDSDR freeware software. It's a sweet little receiver.

A newbie question I have is how I can protect the front-end of this receiver from overload during my transmissions as my house is on a small lot so the main vertical RX/TX antenna will be within 50' of the operating position. The SDR will be on a separate wire antenna of some sort. I'm still saving money to buy a good outdoor antenna so I haven't been able to experiment yet.

I've got a feeling I'll need some sort of TX mute line or an attenuator actuated by a TX relay.

From: Steve Wedge
Topic: 13702 Message: 13707

The problem with trying to use a Drake receiver with a band scope is that the circuits from the RF amp forward are rather sharply-tuned with the PRESELECTOR.

You need something broadband if you want an accurate spectrum display.

From: Garey Barrell
Topic: 13705 Message: 13708

Dan -

The biggest difference is in the test leads!

The DMM has plain ol'wire leads, three feet long or so. When you touch the Red probeto the Grid (Hi-Z!) of an oscillator, the additional capacity to ground is enough to kill the oscillator. Most 'good' DMMs have a 10M or higher input impedance, so no danger of loading most Hi-Z DC circuits.

The VTVM, designed in the era when tubes with their Hi-Z topology were king, has a 10M input impedance for the metertoo!. But... The Positive (Red) test lead is a shielded wire, and there is a 1M resistor right at the tip of the probe, only for DC measurements. The resistor is switched out for AC and Ohmsmeasurements. This results in a 1M isolation right at the probe tip, decoupling all that test lead inductance, capacitance and RF pick up stuff from the test point. The shielded cable even operates as a distributed low pass filter for any RF seen by the probe tip. There have been a few people who 'think' they're smarter than all theVTVM designers and cleverly move that resistor from the tip of the probe to a point inside the meter, placing it so that it is 'automatically' switched in and out for DC or AC readings!! See how much smarter they are?!?!? :-) As with a lotof internet 'wisdom', it ain't.

So you could modify your DMM to accept a shielded 'Red' lead with a 1M resistor at the tip, and compensate for the 10/11 division rate, or pick up a nice Heath or any other VTVM -with probes- to use for RF purposes. Plus, if you haven't already discovered this on your own, there's no way a DMM can competewith a nice, big ANALOG meter when it comes to peaking and dipping things!! :-)

Garey,
It sounds, from what you said, here, that one might be able to make their own test leads.
I have a very nice condition Triplett 650 VTVM, and a Triplett 630 VOM, and a box of leads, that I picked up, for the net sum of, free, ninety free. I actually paid $25 for it all, but sold a second, lesser condition 630, for the initial investment, of $25, so, the rest cost me nothing.
One of the members here, was kind enough, to send me a scan of the Triplett manual.
It appears that there is a 5726 tube, in the HV probe, and I am not certain about the materials to build it.
Any suggestions? Anyone have a probe, they would be willing to part with?

73,
Dan
W3RXO/W6
Pomona, CA
DM14cb

In tough economic times, it is purported to be beneficial to invest in precious metals, like platinum, gold and silver.
Personally, I choose to invest in blued steel, brass, and copper jacketed lead.
As well as, classic old, vacuum tube ham radios.

Sent from my iPad.

You can do that, or you can simply clamp the antenna line voltage with diodes -- your receive will be useless during transmit, but you'll protect the radio. Use two diodes back to back, like this:

```
\|/
| +-|<--GND
| |
+--+----------RCVR
|
+->|--GND
```

This will prevent received signals from swinging more than about 1.4V P-P, which should be plenty of clamping to protect your front end (verify that!) while leaving smaller signals essentially unaffected.

Having posted something similar to that in reference to a Sony ICF-2010, probably 20 years ago, it was pointed out to me that there will be intermod due to mixing in the diodes if strong signals are present that are not enough to cause the diodes to clamp.

Note that the USB DVB-T sticks with E4000 receivers are supposed to have clamping diodes on them. There is at least one eBay vendor that shows you a picture of the board in what he sells so you can see they really have E4000 receivers, and the clamping diode (SMT) is quite visible.

You can get the same sticks (TeraTec) for about half the price, but I have not opened mine to see if the diodes are there or not. The software I use (rtl_fm) verifies they are E4000's.

Yes, that is true. There are ways to mitigate that, but they require
more than two components. :-) Anything between your antenna and
first amplifier will also raise the noise floor -- although I think
with those USB dongles, that's probably not an effective concern, and
on HF it's gotta be pretty noisy to matter anyway.

This depends on the particular VTVM, many were used
with plain leads especially those without built-in leads.
An example of a lab grade meter is the General Radio
1800A/B.
Most VTVM's had about 10 meg input resistance. Many
DMM's have the same resistance and will read the same as the
VTVM. Some VTVM's have much higher input resistance, for
example the Hewlett-Packard 410B or C or the -hp- 412A.

Topic: 13705 Message: 13714

A while back, I modified a Simpson VTVM probe for use with a Fluke 8060A DMM. The standard 1 meg probe resistor was changed to a 10-meg, 1% metal film type. Then, a shunt at the DMM was made using two 1% resistors to get a value of 1.3 meg. All displayed DC voltage readings are then multipled by a factor of 10x. On the DMM, it's just a simple matter of mentally moving the decimal point over one place. To get the proper shunt value, I used a pot (configured as a rheostat) with a fixed resistor and dialed in the amount of resistance needed to create a precise 10:1 ratio.

The Simpson probe cable terminates into a male BNC connector. Since the Fluke portable DMMs use a standard 0.75" banana spacing, a BNC-to-dual banana adapter was used. A Pomona series adapter allows the user to add a perpendicular shunt with a dual banana plugged in sideways. So, apart from the probe resistor change and making a shunt network, no other work was required. The input Z at the probe is 10 meg, but now the probe isolates the DMM from the measured circuit. Switching to AC./Ohms is easy: Flip the probe switch and remove the shunt banana plug.

After that work, you might think it's used a lot, but I can't seem to break away from the VTVMs. It seems like gear of this vintage "needs" to be serviced with test equipment from that era!

Paul -

Seems like a lot of work to modify a DMM which makes a LOUSY 'peak/dip' machine!! :-)

DMMs are kinda like digital radio frequency readouts..... Just because they have umpty-five digits doesn't mean you have to use them.....

Ham radio, the channelized radio service. What's really fun is listening to five of them argueing over which one of them is OFF frequency, when none of them are ON 'frequency'....

A lot of work for what you ultimately end up with, but an interesting idea none the less. The HP 410b/c and RCA Voltohmyst and other VTVM's are still common enough at hamfests for relatively little money, and can be electrically restored to work just as well, if not better than new for less than a new Fluke 77 would cost you. Sometimes there is just no substitution for a big analog meter scale, Hi-Z input or not.

No Garey, *I'm* right on freekency- My brandy new ICOM says so!

Regards,
Chris

Garey,

For the benefit of the rest of the group, mine is missing the 10 balls in the front race. None of my local ACE stores carry the 1/8 inch size. None of my hobby shops had any bearing balls.

I did find a vendor on ebay located in SoCal offering 100 pcs with free shipping. It was $5.80 with CA sales tax. My order has already been marked as shipped so should arrive on Wed or Thurs. I'll have plenty now. If anyone needs some, let me know -hihi.

Bill -

There is a hole in the back wall of the 'gearbox' to access an Allen setscrew. There is a clearance hole in the back end of 'some' covers, but if you've not been inside it's risky to go that way. Best to remove the cover so you can see!

Hopefully some gorilla hasn't broken the coil form loose!!!!

Tighten the setscrew only enough to take out any side to side play in the MAIN TUNING shaft. If the set screw has been loosened TOO much, the single ballbetween the end of the shaft and the screw. The balls in the front can also fall out if too loose.

There should be 10 balls, 1/8" dia steel (ACE or True Value) balls in the front race, and one at the back endof the shaft.

Garey,

I suppose this was a bit of a learning exercise to see if I could get it to work with a simple probe change and use of a shunt. But now, I have a non-standard probe that has to be tagged as such! Like many DMM's the 8060A has a quasi-analog bar graph, but by the time you're reached a peak/dip you've driven well past it before the meter responds.

BTW, last year I purchased a Keithley 6-1/2 digit bench DMM. Hate it. Way too many digits and non-intuitive. But it was deep discounted and just "had" to have it. Gullible me.

Paul -

Seems like a lot of work to modify a DMM which makes a LOUSY
'peak/dip' machine!! :-)

DMMs are kinda like digital radio frequency readouts..... Just
because they have umpty-five digits doesn't mean you have to use
them.....

Ham radio, the channelized radio service. What's really fun is
listening to five of them argueing over which one of them is OFF
frequency, when none of them are ON 'frequency'....

Paul Christensen wrote:
> A while back, I modified a Simpson VTVM probe for use with a Fluke 8060A DMM. The standard 1 meg probe resistor was changed to a 10-meg, 1% metal film type. Then, a shunt at the DMM was made using two 1% resistors to get a value of 1.3 meg. All displayed DC voltage readings are then multipled by a factor of 10x. On the DMM, it's just a simple matter of mentally moving the decimal point over one place. To get the proper shunt value, I used a pot (configured as a rheostat) with a fixed resistor and dialed in the amount of resistance needed to create a precise 10:1 ratio.

>
> The Simpson probe cable terminates into a male BNC connector. Since the Fluke portable DMMs use a standard 0.75" banana spacing, a BNC-to-dual banana adapter was used. A Pomona series adapter allows the user to add a perpendicular shunt with a dual banana plugged in sideways. So, apart from the probe resistor change and making a shunt network, no other work was required. The input Z at the probe is 10 meg, but now the probe isolates the DMM from the measured circuit. Switching to AC./Ohms is easy: Flip the probe switch and remove the shunt banana plug.
>
> After that work, you might think it's used a lot, but I can't seem to break away from the VTVMs. It seems like gear of this vintage "needs" to be serviced with test equipment from that era!

Paul -

There was a story in QST back in the 60's by John Troster, W6ISQ.
Actually there was a whole series of them, but I think this was my
favorite. I can't remember the name, but the tag line was 'love them
rippling dits'. Every time I hear 'too many digits' the line just
zips through my fevered brain!!! :-)

The man was a master story teller, and reflector of Ham 'lid'
operators........

I acquired an old -hp- 410-B not too long ago.
Everything met specs, the only thing I did was to replace the selenium rectifier used for the low ohms range with a silicon diode. No other changes are necessary. This as an -hp- service note mod. The meter is the best for measuring really high impedance circuits like AVC. The 410-B has 122 megohm input resistance on all DC ranges. The DC probe has a 22 meg resistor in it near the tip. Another useful feature is its ability to measure very high resistance values. It goes high enough to test for leakage in capacitors. Mine is an early version with the rounded corner case, later ones had the shadow box type case, I don't know when the change was made. The -hp- 412-A millivoltmeter has an input resistance of 200 megohms and an even greater resistance range but is not as versitile as the 410-B. It has a 1 meg resistor in the tip of the DC voltage probe. The 410-B is an ideal instrument for working on tube transmitters and receivers.
The problem we had with the 412A at -hp- was the photo chopper. I don't know how well these have stood up. Other than that it was an accurate and reliable meter. If you have one beware that the insulation used on the range

switches is some strange low loss material that will melt
with most cleaning solvents.

Hi Garey,
No capacitor is across the key terminals. What kind, value and/or voltage should I use? I have no problem when the key is unplugged.

Thanks for the info. I thought that might be the problem.

Art -

You don't need a cap across the key. Some put caps across keys for
various reasons, and a leaky cap could present as you describe.

Is the key body itself clean and dry, especially around the contact
area.??? Are the connections inside thekey jack insulated from each
other?

You could try just plugging in an 'empty' key plug. If it still keys,
you may have a gassy V4 or V6.

The circuit is a 3.3M resistor from the -60 VDC bus to the ungrounded
key terminal. A 47k and 330k resistor in series go from the ungrounded
key terminal to the Grid of V4, and a 68k and 15 ohm in series gofrom
the ungrounded key terminal to the Grid of V6. When the key is UP,
-60V is applied to the Grids of V4 and V6, cutting off both stages.
When the key is pressed, the grids go to a low dc voltage based on the
grid resistors, allowing the stages to amplify. A gassy tube is a tube
whose Grid loses ability to cut off the current flow as it heats up,
which could result in what you describe. The only way to test is with
substitution of a good tube.

Let us know what you find!!

13723. Re: Stand alone spectrum display

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-14 11:59:57 UTC
From: slowcountry1
Topic: 13702 Message: 13723

Garey,

Specifically, I would like to have a band scope, like some of the newer rigs have such that I can see signals on a given band. One, so that I can see a signal of possible interest and move to that frequency to have a QSO and Two because there are a bunch of interference around my location, leaking cable TV and other stuff that I do not have a clue yet as to what it is.

I thought maybe someone had made an older, stand alone scope that could be attached to a coax and used to see what was in the spectrum. The SDR looks like a cheap way to do it. I looked up the site that you referenced, I was wondering how well their software worked or if there was a better program that someone would recommend. Will a standard sound card suffice for its operation and is there any other hardware needed to operate SDR?

Do you use an antenna connected to your transceiver and then somehow switch it out during transmit or do you have an antenna dedicated to the SDR? I only have a 5BTV capable of listening to the low bands at the moment. If it is not feasible to share an antenna and switch out the SDR on transmit, then I will have to figure out what to use for a receiving antenna.

I also thought it would be interesting to monitor my transmitted signal. Maybe learn something in the process and ensure carrier suppression etc.

SDR kind of defeats the purpose of operating a vintage station however; it may prove to be very interesting and inexpensive to get into.

Thanks,

Doug - N9XTF

Doug,

Placing the SDR after the first mixer "would" have worked but for Drake's superb RF engineering; they placed a highly selective preselector ahead of it. Post 1st mixer, the result is a display that shows a "hump," and becomes more evident on the lower HF bands.

I don't think a small, shielded RF relay (e.g., Teledyne) for preselctor bypassing would work either. The preselector is ganged at several places, one of them being at the antenna input ahead of the RF amp. One could try a relay bypass from the antenna to the first mixer but signals above 20m would be weak relative to the noise floor and the first mixer would have zero selectivity against out of band sources, like nearby high power AM-BC stations. Yep, it's a tough one to solve.

Doug -

There are various units around, essentially what you are asking for is a 'spectrum analyzer'. Heathkit offered the 'HamScan' back in the 60's, same package as the 'Monitorscope'. I don't recall the specifics, I never owned one, but basically it tapped off of the IF of the receiver and displayed a representation of the spectrum seen by the receiver, BEFORE the IF selectivity was applied. So typically you could see 10, 15, 20 kHz either side of the tuned frequency.

Later, Kenwood offered the SB-220 for use with the TS-940 in the early 80's and it worked pretty well, but again was limited by the bandwidth of the front end of the receiver. These all worked best when used with receivers _without_ 'roofing filters' to give the widest view possible. Judging from the cost of 'new' radios, I suspect they have a separate receiver channel with a bandwidth of 100 kHz or so, not for listening, just to drive the display. Without much thought, that's where I would start as an engineer with an unlimited budget! :-)

The little Ensemble II SDR receiver is a real doll. It's smaller than a paper-back book. It has an12VDC input, a 'stereo' audio out to the computer, aUSB port to the computer, and an antenna connector. The software is adapted from the best commercial SDR product, the Flex radios. Your monitor becomes a front panel, complete with gain, bandwidth, detector, S-Meter, etc.There is a transceiver version, in the same cabinet!,) for about $20 or so more, 1W SSB/CW..... All are kits, which only adds to the fun!! :-)

The documentation is fabulous, all on WB5RVZ. There is a Yahoo group, Softrock, with plenty of support, both concrete and existential!

Computer sound cards are a whole separate article, and definitely affect the quality of the receiver. Makes sense, since ALL signal manipulation is done at audio frequencies. Most modern PC cards are at least adequate, the primary requirement is that it have a stereo (two-channel) microphone or auxiliary input. This eliminates many laptops.

All that said, SDR has limitations. Having a 'wide open' front end makes it less than great in crowded band conditions. Although it has DSP IF bandwidths down to 25 Hz, there is no 'roofing filter', the 0 - 30 range has only four band filters. But it does surprisingly well in contest conditions.

There used to be demonstration recordings that would allow you to download and install the software (Free) and then 'play' audio recorded samples of on the air activity, during a contest. You can

tune from signal to signal, just like using a real receiver. I don't know if those are still available, but a Google search might turn them up. Another feature of the software allows you to make your own recordingsat the 'push of a button' on screen!

Snipping....

Probably the oldest display was the Panadaptor, these were made in various models to work with communications receivers. I think the first ones appeared about 1940 but have not researched it carefully. The Panadaptor was a rudimentary spectrum analyzer and had all the limitations the snipped part of the above post talks about. Panadaptors were used by the military for ECM, finding and identifying radar transmissions, etc. The S-27/S-36 and also the SX-28 were available with connectors for Panadaptors and I think Hallicrafters eventually bought the company.
None of these is a true wide-band spectrum analyzer but can give some idea of what is surrounding the received frequency. I think anyone who wants a true spectrum analyzer should get a stand alone unit to couple to the receiving antenna. It would be advantageous to have a marker of some sort for the receiver frequency. I don't know how to do this but someone here probably does.
Unfortunately just coupling crude tuner to a conventional receiver is not very satisfactory. I have not looked at the circuits of the expensive rice-boxes but suspect the

spectrum analyzer function is made separate from the
receiver part possibly a whole separate receiver.

One neat thing about the classic Panadapt{o,e}r is that it used an overcoupled tuned network to provide an amplitude response that was approximately the inverse of the response of the receiver. This flattened out the signals across the band of interest.

13729. TR7 band switching problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-14 23:58:57 UTC
From: k2gtm1
Topic: 13729 Message: 13729

Hello all!

I've been dreaming about owning a TR7 for decades, and I finally got an excellent-condition one with all the bells and whistles (PS7, NB7, DR7, AUX7, FA7, SL-300, SL-500, SL-1800). Best part, the price was very reasonable! :)

Unfortunately, it has/had some issues I'm working on:
- There was no speaker audio. Caused by a bad LM380 audio amp chip.
- Intermittents. I cleaned all of the Molex pins and re-soldered them to the boards.
- A strange issue with band selection: I haven't been able to figure this out yet and I'm hoping someone can help...

The radio will not tune above the 23.5 MHz segment. Also, the segments are out-of order when going through them using the DR7 UP/DOWN buttons. Here are the frequencies I get when the PTO dial is set to 0 00 for each band switch position and DR7 step:

BAND SWITCH // # of STEPS // FREQUENCIES
1.5 - 2 // 1 // 1.5
2 - 3 // 2 // 2, 2.5
3 - 4.5 // 3 // 3, *2.5, 3
4.5 - 7 // 5 // 3.5, 4, 4.5, 5, 5.5
7 - 10 // 6 // 6, 6.5, 7, *6.5, 7, 7.5
10 - 15 // 10 // 8, 8.5, 9, 9.5, 10, 10.5, 11, *10.5, 11, 11.5
15 - 22 // 14 // 12, 12.5, 13, 13.5, 14, 14.5, 15, *14.5, 15, 15.5, 16, 16.5, 17, 17.5
22 - 30 // 16 // 18, 18.5, 19, *18.5, 19, 19.5, 20, 20.5, 21, 21.5, 22, 22.5, 23, *22.5, 23, 23.5

(* denotes where "step-backs" occur, even when pressing UP)

Hopefully this makes sense!

Here's what I've figured out so far:
- The DR7 UP/DOWN buttons work correctly and the PROM chip correctly prevents the user from going too high or too low within the band selected.
- The number of 500 kHz steps selectable within each band is correct.
- U9005(LSD) and U9006(MSD) on DR7 are loading the correct values into the translator board (i.e. "83" for 1.5 MHz and "27" for 29.5 MHz).
- The radio transmits and receives properly on the displayed frequencies. (The radio is trying to get to the correct 500 kHz segments, but can't.)

SO, I've gone as far as I can considering I don't have any extender boards to test the translator board (and especially the divide-by-n circuit) directly. I'm guessing it must be one of the ICs in that circuit that isn't working correctly. I could just replace all four of the ICs, but I'd rather know exactly what the bad part is.

Does anyone have any idea what would be causing this mess?? Also, would anyone be willing to lend me a working translator board so I can try it in my TR7? Your help will be GREATLY

appreciated!

I'm in love with this radio - even if it doesn't work right!! :)

Thanks and 73,
-Greg K2GTM

Doug,

Here's my plan, which may give you some ideas. The Drake TR-7 has a REC ANT loop on the back, mainly used to feed the RX antenna line after the low pass filters to and from an R-7 receiver. With no R-7, these connections are jumpered. I also have a vintage Ameco tube preamp/preselector with an auxiliary receiver port. I plan to break the loop and insert the Ameco inline at thsi point, and feed an R820 SDR dongle from the auxiliary port. I expect some of the hump effect from the preselector, but I don't think it is exceptionally sharp on the Ameco. We'll see. Part of my reasoning for doing it this way is that the Ameco will not need to T/R switch in this configuration; in my particular case it will also act to overcome the ~3 dB hit from the antenna splitter in my R-7A.

13731. R-4B Calibrator Mystery Solved!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-15 00:59:03 UTC
From: Steve Wedge
Topic: 13731 Message: 13731

This simple circuit was kicking my butt, so I had to assume that more than one thing was wrong with it - especially since (a) it didn't work when I got the receiver, after (b) the previous owner had obviously removed it and worked on it. During that process, the PO created other problems, such as shorting the replacement crystal case to the feedthrough where the jumper connects 25 kHz to the 0.001 uf cap plus a couple of other sloppy solder joints.

After replacing the electrolytic with Hayseed's 200 uf part from the kit, I was still getting very erratic delayed or no starts of the calibrator. I had already noticed that the trimmer capacitor did not change the frequency and the calibrator frequency was definitely off-frequency. I discovered tonight that the oscillator wouldn't start at all anymore - unless I would touch it with a scope probe.

I increased the tension on the trimmer cap rotor (it was obvious that someone had messed with it). Nada. I then metered out the connection from the crystal/FET junction to the trimmer. No connection. Bingo!

There was an invisible break in the etch - I reflowed solder along its length and that did the trick.

Tomorrow, I start the refurb and replace the can capacitor - assuming I'm not in the middle of any real estate happenings ;-)

Greg,

Sounds like you are on the right track. More comments below:

On Tue, 14 May 2013 23:58:57 -0000, k2gtm1 wrote:

>- Intermittents. I cleaned all of the Molex pins and re-soldered them to the boards.

Did you check the female connectors on the translator board? They could need cleaning or re-tensioning.

>SO, I've gone as far as I can considering I don't have any extender boards to test the translator board (and especially the divide-by-n circuit) directly. I'm guessing it must be one of the ICs in that circuit that isn't working correctly. I could just replace all four of the ICs, but I'd rather know exactly what the bad part is.

You should be able to figure out which divider is bad by comparing the BCD code that you are presenting to the board vs. the BCD code for the band you are actually getting. I imagine the J-Ks and ANDs are working fine, or you wouldn't be getting any bands.

Bob, W7AVK, used to offer a nice extender board repro. I don't know if he still does, but here's his info:

http://www.wb4hfn.com/Services/W7AVK/tr7ext2.htm

>Does anyone have any idea what would be causing this mess?? Also, would anyone be willing to lend me a working translator board so I can try it in my TR7? Your help will be GREATLY appreciated!

The boards show up on that popular auction site for not a lot of money. I see three there right now for 35 bucks.

>I'm in love with this radio - even if it doesn't work right!! :)

From: KA5DWI
Topic: 13670 Message: 13735

Hi Garey,

Thanks for the feedback.
I plugged in an "empty" key plug and still had the carrier. I also plugged in my electronic keyer and had the same result. The rig is clean and free of any debris (dust), loose solder or moisture.

Therefore, I will replace V4 and V6. Know any reliable and inexpensive sources for a 6HS6 Mixer and a 12Y7A Driver tube?

The source here in Dallas/Ft Worth wants a small fortune and driving around among the road construction here offsets shipping fees :)

Thanks again,
Art KA5DWI nr. Ft Worth TX

Art -

Yes, the 6HS6 is an expensive tube. $15-20 is not uncommon. The 12BY7 isn't cheap either, probably more in the $10-12 range.

Check with<http://www.esrcvacuumtubes.com/>. There are manyothers, but I have been dealing with Stan for a long time and he is reliable. Specify US made, RCA, Sylvania, Zenith, GE, etc.

Ifyou have a VTVM or high impedance DMM you could measure the grid voltage on both those stages with the key up and see if either one drifts up (less negative voltage). I would expect to see -20 to -30 V in CW MODE with KEY UP. You could start by just measuring the voltage across the key terminals in CW, KEY UP. It should read about -60 VDC unless the meter is low-Z like one of the Harbor Freight 'bargain' types. Any good DMM should be 10M or greater input impedance and read about -60 VDCacross the open key.

As the happy owner, and installer, of 3, of Paul's ESAC-4 kits, as well as 2, AC-4R kits, I am pleased as punch, with Paul's design. The AC-4R kit, is a good design, but I am far happier, with Paul's ESAC-4 kits. They install easier, and they have a cleaner "Look" to them. You will be very pleased with one, should you acquire it. I recommend his design, highly.

In tough economic times, it is purported to be beneficial to invest in precious metals, like platinum, gold and silver.
Personally, I choose to invest in blued steel, brass, and copper jacketed lead.
As well as, classic old, vacuum tube ham radios.

Sent from my iPad.

Steve -

Good job!! The simplest ones can sometimes be the toughest..... I have a small high intensity Maglite that I used behind PC boards to look for breaks. I have to admit though that it would have taken me a while to get to that point!! :-)

But it IS satisfying when you finally find all the little 'presents' left by your predecessor(s)!

Have to agree with you, Dan. Paul's ESAC-4 kit went in without a hitch and worked fine. Soon I will get to install his ESAC-3 kit (it's almost finished in development) and I'll write a report on that installation here when I've finished .

I am looking forward to seeing some of you at Dayton in a few days!

Subject: Re: [DrakeRadio] Paul's ESAC-4 Boards

Dan,

Thanks for that clarification. I didn't notice when I replied to
another list member that he emailed directly. Paul's email is
elespe@... .

13746. SPR-4 problems

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-15 17:27:02 UTC
From: Geoffrey S. Mendelson
Topic: 13746 Message: 13746

I have an SPR-4 with some problems. I thought they might be idiosyncrasies until I picked up another SPR-4 which does not have these problems.

The first is tuning. The tuning knob takes some force to move in either direction, the one on the "new" radio spins smooth as silk. At some points on the dial it goes "thunk", needs more force and then moves. It does tune as you move it.

I've replaced the rubber tube. With the knob off there is a small silver colored shaft which rotates (and tunes) freely. The dial does not move, and it has a limited amount of rotation.

Turning the outer shaft, which does move the dial, is difficult.

The second problem is that the radio goes "click" or "tick" and becomes almost silent. A previously unheard, low level hum comes out of the speaker. The S-meter continues to read normally.

This goes on for a few seconds to several minutes and then goes back to normal. It happens in all modes.

Changing the settings of any of the switches does nothing.

Sometimes a local FM station can be heard muffled in the background if the audio gain is turned all the way up.

Note that I am in Jerusalem, so recommendations for repair people, or offers to look at it need to be from people in Israel.

Thanks in advance for any help.

Geoff.

Bill -

Here is a photo of the two boards in place. The one on the right side has been reworked slightly to give more room around the late model transformer. The first one fit fine, just was tight.

Geoff -

See <http://www.wb4hfn.com/DRAKE/DrakeArticles/PTO/Drake_PTO.htm> for an article on the C-Line PTO. Same as SPR-4, just single dial. Problem is most likely swollen nylon gears from petroleum based lubricant. Nylon(and Brass) gears do NOT need oil or grease....

Your second problem sounds like it may be either a cracked resistor or a cracked PC trace. Troubleshoot the resistor by pushing on each resistor with the eraser end of a pencil. Resistors can overheat and crack, and still look perfect. A little sideways force and they fall in half! It could also be just a cracked solder joint, same technique, just poke around with your stick and see if you can make it happen. From your description, it's almost certain to be in the audio stages, possibly the detectors IF it does it on SSB and AM.

Of course exercising the switches is a good idea, plus treatment with DeoxIT.

PC board trace cracks can be detected by the pencil technique as well, and sometimes with a BRIGHT light behind the board, examining each trace for 'light leaks'! :-)

Let us know!

True, they are already built but at least we get the satisfaction of removing the old components and then hooking up the new boards.

A great product. I have recently installed one and have another on the way.

13755. Re: [DrakeRadio] Vacuum Tube Volt Meter VTVM versus Digital Multi Meter DMM

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-14 04:46:45 UTC
From: Charles Ahlgren
Topic: 13705 Message: 13755

Dan:

I am not an expert, but have had some experience with older test gear; mainly back in the early 1970's when I repaired Heathkit test gear at my local high school...Senior class electronics....

At any rate, a standard Vacuum Tube Volt Meter (VTVM) has an 11 M ohm input...This is mainly so the meter circuit will not pull a lot of current out of the circuit during test...Also, the VTVM provided a nearly constant impedance across all ranges of voltage...So you get good accuracy over a wider range found in the older tube gear...

I think that is basically how it worked... So if you are measuring lower voltages, your meter has similarly smaller impedances that pull down the circuit...

You might want to take a look at this site....
http://tone-lizard.com/VTVM.htm

To the group: Is there a procedure to get a message posted on the mailing list?

Garey, hi.

I was in luck yesterday. A friend came home with me after a hamfest. He quickly found the two 6EA8s to swap and did it. There was no change in simptoms. Problem is, I forgot to have him swap them back.

To find out more, could I, maybe, inject some kind of signal starting at the receive audio stage and moving back until I lost the signal? Or is there an easier way.

Thanks.

13757. Why not a kit

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: Paul Kraemer
Topic: 13757 Message: 13757

Why not a kit?
Good question which comes up time to time
I don't really have a great answer. I polled some folks on the "other" reflector once about a power supply kit because I thought the world was yearning for our old Heathkits but indications were running built was better if it was affordable, but just their opinion.
I could look at it and offer either way for a discount. Work wise it is inserting 20 components, soldering and trimming 40 leads. Shipping would be easier and much cheaper.
Here, everything on a circuit board is machine soldered and the ladies are very adept at inserting components so manufaturing time is minimal. Testing and packing takes longer!
I am flexible and gladly go either way or both
I did offer it to one overseas inquiry as a means of minimizing postage
So, if you want a kit, I'll look at how much less that can be

From: Al Parker
Topic: 13727 Message: 13758

Hi al,
I've reached the point that for this application I'm happy that it's already built ;-) Lotsa projects in the queue, and I work slower than I once did.
I bought one of Paul's kits about a month ago, finally got a round tuit & put it in a week or so ago, now. It went in very nicely. I put it in a late AC-4, and he had noted that the fit wouldn't be "perfect" for one of the boards, and he'd send an updated board. I opted to keep what I had, it's not that far off.
5 or 6 yrs ago, maybe, I'd used one of Mike Bryce's AC4-R kits, (don't have that supply now) and still have one more, which I had planned to use now, right after Paul's, so I could write up a comparison. I haven't gotten tuit for this one yet, it'll probably have to wait another cupla wks b4 I can do it.
I like them both. But as Dan said, Paul's may make things look cleaner. I'll be able to compare better, later.

Howard -

I can't figure out why your messages keep ending upin the SPAM filter for the list. You might want to copy me when you send something so that I get it and know to look there. I don't think to look because there's almost NEVER any messages there.....

I'm running out of ideas to try, within our limitations. The fact that you are able to hear the transmitter on a separate receiverindicates that all of the important circuits are at least working, although perhaps not up to full speed. This also indicates that the receiver should be working, at least a little. The slide switch on the left side MUST be in the 'forward' position.

When in Receive, withthe Calibrator on, does the S-Meter move as you tune across a calibration point? The presence (or absence) of S-Meter Indication kind of divides the receiver in half, giving us at least an idea where to start.

Do you hear any hiss or other sound at all out of the speaker in receive?

I think we're going to have to make some DC voltage readings of the various stages. Exercise the switch several times and then leave in the foward position.

Verify that all tubes are heating. Some get QUITE hot, so be careful.

Paul -

Perhaps it could be about 40% off for kit form, like Heath used to
do!?!? :-)

Take a look at the photos section and see if you want to add or
subtract anything. I just picked a small sample because some were
asking and I didn't know if you were already 'out of range'.

Paul,

Please consider keeping the "built kit" as at least a choice. Some of
us old guys don't solder as well as we once did, due to losing eyesight
and motor skills. Also, a LARGE number of us are procrastinators (few
will admit it like I will, hi) and the more work, the longer it gets put
off!!!! I consider your built price a REAL bargain, and I might charge
the kit builders for the priviledge (ducking and running) :>)

I wanted to post these to all who asked today

The current version of the AC-4 rebuild kit ES4AC-4PS. Notice the transformer and moving can capacitor holes resolved. This fits EVERY AC-4 I have found to try and I am having so much fun converting them it is a challenge to keep from offering to pay the shipping both ways so I can convert one more supply! That easy.
http://s358.photobucket.com/user/ee_design/library/AC4REBUILD

Then there is a special kit for the AC-3. Could have used the same boards as for the AC-4 but this is nice, covers the holes, has the bias pot that was covered up by new boards, and, not shown, is the supplied perforated metal cover for the board for safety reasons. This one I seriously would make the offer send me your AC-3 and I'll do it for you just so I can get pictures of an un-modified AC-3. Mine was worked on decades ago and the cable is not original, neither is the added connector for antenna relay. It would be nice to have pictures of an original to upgrade
http://s358.photobucket.com/user/ee_design/library/AC3

Just for fun I included some pictures of a MN-2000 I rebuilt a while back. I replaced the arced and melted selector switch with ones available from Soviet source on ebay for the ridiculous sum of about $3. The cabinet is a repaint too and has side by side comparison with a stock MS-4 (FWIW)
The shack picture---shack of the day---that particular day. Rigs here may come and go but the Drakes stay here forever.
Enjoy!

Paul,

I have a "brand new" looking AC3 that I would pay the postage on both ways and give you the pleasure of fixing. No joking, I've NEVER had or seen one this pristine.
Let me know when you aren't busy (fat chance) and I'll send it.

13764. Re: [DrakeRadio] Why not a kit

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-15 19:59:43 UTC
From: Chris Farley
Topic: 13757 Message: 13764

Hi Paul,

I for one would be more inclined to purchase kits, or even bare boards than a finished product if the price difference is more than a few dollars. Not only 'cause I'm cheap, but because I could select the brand and spec electrolytic caps I personally prefer! If it's cost effective to offer them both (or 3) ways, It would at least be worth a shot to see how they market!

Regards,
Chris kc9ieq

Why not a kit?

Good question which comes up time to time

I don't really have a great answer. I polled some folks on the "other"

reflector once about a power supply kit because I thought the world was

yearning for our old Heathkits but indications were running built was

better if it was affordable, but just their opinion.

I could look at it and offer either way for a discount. Work wise it is

inserting 20 components, soldering and trimming 40 leads. Shipping would be

easier and much cheaper.

Here, everything on a circuit board is machine soldered and the ladies are

very adept at inserting components so manufaturing time is minimal. Testing

and packing takes longer!

I am flexible and gladly go either way or both

I did offer it to one overseas inquiry as a means of minimizing postage

So, if you want a kit, I'll look at how much less that can be

Paul,

I just want to add my comment to the chorus to say how pleased I am with my ES4AC-4PS. The ES4AC-4PS is the second AC-4 upgrade kit I've installed and the first from Electronic Specialties. Mechanical integrity is without a doubt the best with straight forward installation. Great service. Great product.

13768. Re: [DrakeRadio] R-4B Calibrator Mystery Solved!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-16 00:34:40 UTC
From: Steve Wedge
Topic: 13731 Message: 13768

Yeah, it is satisfying - which is why I do it.

I stripped it this morning because I figured I'd have a few hours - and the phone started ringing for showings. The joy of spring in real estate I might even have an offer coming; told one of my colleagues this happens whenever I decide to go fishing or tear into a radio. Told him I'll have to get more radios.

Once the calibrator and all bands were working, the receiver got stripped and bathed today and I've got it about half put back together. The chassis looks somewhat better than I anticipated. Still have to clean the knobs and some other parts. I'm debating replacing all the tubes with NOS but think I'll only do that if it replaces my current station R-4B. Have to look at the chassis side-by-each first. Figure it'll get the smoke test tomorrow, then I change the can cap.

This one belonged to a CW op, as the 10m xtal on top is 39.1. That's how I usually configure mine.

The B's are becoming second-nature to me - to the point where I have to be careful when working on A's or C's - especially A's, as I found out a few weeks ago when I swapped the 6EH5 and the 0B2. I was lucky on that one with only a smoked resistor.

I'm going to have more fun with this R-4C I recently got, but that will be a new post...

Steve -

Good job!! The simplest ones can sometimes be the toughest..... I
have a small high intensity Maglite that I used behind PC boards to
look for breaks. I have to admit though that it would have taken me a
while to get to that point!! :-)

But it IS satisfying when you finally find all the little 'presents'
left by your predecessor(s)!

13769. No-screw Knobs on the R-4B

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-16 00:37:05 UTC
From: Steve Wedge
Topic: 13769 Message: 13769

Does anyone on here know the reason why Drake used knobs without setscrews only on the AF and RF GAIN controls? Was is cost-savings? That's the only logical reason I can see. Putting those on the switches would have had them falling off all the time from the vibration.

They're kind of a pain, since I've seen many front panels damaged by those knobs when they're pushed on too far.

Steve -

That onehas always puzzled me too. I guess they're slightly cheaper,
drill and tap the set screw vs slip in a small, easily lost spring clip.

But couldn't have been more than a few pennies, in production
quantities, ona $400 receiver. Certainly wouldn't have been a time
saver in production. Plus having to inventory and keep straight two
types of identical appearing knobs. Maybe someone got a great buy on
some? They wouldn'thold up with rotary switches. I suppose
it'spossible that the controls used came only with the flatted shaft,
but even that still works fine with the set screw. I always replaced
them with a SS type as soon as I got a new receiver.

I had a cold solder joint on an SPR-4 cause a similar problem.

Garey's spot-on about the Nylon gears, unfortunately. You can try the fix on 'HFN's site.

Geoff -

See <http://www.wb4hfn.com/DRAKE/DrakeArticles/PTO/Drake_PTO.htm> for
an article on the C-Line PTO. Same as SPR-4, just single dial.
Problem is most likely swollen nylon gears from petroleum based
lubricant. Nylon(and Brass) gears do NOT need oil or grease....

Your second problem sounds like it may be either a cracked resistor or
a cracked PC trace. Troubleshoot the resistor by pushing on each
resistor with the eraser end of a pencil. Resistors can overheat and
crack, and still look perfect. A little sideways force and they fall
in half! It could also be just a cracked solder joint, same
technique, just poke around with your stick and see if you can make it
happen. From your description, it's almost certain to be in the audio
stages, possibly the detectors IF it does it on SSB and AM.

Of course exercising the switches is a good idea, plus treatment with
DeoxIT.

PC board trace cracks can be detected by the pencil technique as well,
and sometimes with a BRIGHT light behind the board, examining each
trace for 'light leaks'! :-)

Let us know!

I try to keep everything as original as possible but will change 'em out of they're too close to/rubbing the panel. Originality is one reason but another reason is so that all the knobs look to be about the same age.

Garey, thanks.

I read the article and decided my best shot was lubricate the ball bearings.

I made this decision based on the following observations and that my requests on local lists for someone who is familiar with Drake 4 line radios received no replies:

1. The radio looked like it had been in an outside shed for the last 20 years.

2. It came with a box of spare #47 bulbs but the ones in the radio were burnt out, so it was unlikely anyone had been in it.

3. It had been dropped on it's back (the chassis around the speaker jack was pushed in), it may have been dropped on it's front too.

4. Looking in from the top showed no traces of oil on the bearings, but it was NOT a close inspection. There are two water/rust stains on top of the metal cover the light bulb clamps into. They also may be other substances like coffee, tea or coca-cola, I can't tell.

I opened it up, and very carefully located the ball bearings. They were covered with this dark brown goo, which looked like it was grease 30 years ago and now had dried up.

Using a q-tip, I carefully applied 3 drops of sewing machine oil, one at a time, to the bearings, which dissolved the old grease and a lot of it came up with them. They now seem to be well lubricated.

The dial still is very stiff to turn, but not as bad as before. It still goes bump and skips every once in a while. If I am not careful, the tuning knob pops off.

If I am slow and careful, it will tune from 0 to 500.

While I had the radio open, I tried adjusting the dials by pressing the clutch levers. I found that if I pressed the lever closest to the center of the radio, the dials would spin freely. You can go from 0 to 500 with no restrictions, no bumping, and a very light pressure on the tuning knob.

Release the clutch and it went back to normal. :-(

Any ideas? All suggestions would be appreciated.

Thanks in advance, Geoff.

Geoff -

OK. Yes, the axle grease that Drake used 30+ years ago has long since dried out. It also forms little rock-hard 'clumps' that can account for some crunching or 'bumping' of the tuning, causing the receiver to skip frequency. Best is to clean ALL the old grease out, then re-lubricate with a drop or two of oil. it's not a 'high speed' or heavily loaded bearing, so really doesn't need grease. There is also an Allen head set screw at the back end of the drive screw to adjust the bearing pressure. It should be tightened just enough to take out any side play of theMAIN TUNING knob.

If the receiver has been dropped, it's possible that there is a slight bend in the main tuning shaft.

The problem with oil on the nylon gears isn't visible, just a drop or two of oil on the hub/shaft can swell them enough to bind. As you found, if you disengage the gearing, the nylongears should spin freely ontheir shaft..

Steve may have some more ideas, he's just been going through an SPR-4. I've never had one, so a bit in the dark.

You will find more Drake expertise here than anywhere else! :-)

I didn't know John had them. Good to know. I don't need any but I seem to recall someone else asking about them not too long ago and I got rid of just about all I had.

Is Drake still in business? I thought they closed permanently about a year or so ago.

Thanks,
Barry - N4BUQ

I don't have personal knowledge about Drake, just that they still show a web presence and it is mostly Cable TV stuff now. Last I knew, John still works in their service department and sells off mostly Drake Radio pieces left on Ebay. John is good to work with, and has helped me with many Drake repairs. I found these fuseholders while looking his website over for some Drake parts.

Hi Garey.

> True... I may be mistaken, but I believe it was always the AF GAIN
> control that had the push-on.

I just check to see exactly which knobs were push on:

TR-3 Rcv & Xmt Gain

TR-4 Rcv & Xmt Gain, Plate, Load, and RF Tune

The knobs on the TR-4, while the same style, may not all be original.
Somewhere along the line, someone(s) else had tinkered with the rig.
My adventures getting it back to original are in the archives :-)

I also bought a bunch of replacement knobs which all have setscrews.

The ones from RS, Mouser, etc., are not typically as well made as the old LittleFuse holders. A lot of BA gear used the LittleFuse holders (or equivalent).

I just bought a panel-mount fuse holder at Radio Shack after temporarily taking one out of a spare Tektronix chassis from the 1970s or early 1980s. I was surprised, but they were about identical. They even had the same number on them (R3-14D). I am sure the RS one is made in China.

13785. Re: [DrakeRadio] SPR-4 problems

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-16 17:45:48 UTC
From: Steve Wedge
Topic: 13746 Message: 13785

I was fortunate in that I did not have any problems with the PTO mechanicals on the SPR-4 that I had. The PO had taken all the electronics off and I had to put it back together (as well as the Power Supply/AGC PCB) but I lucked out.

Garey has an excellent point as far as bent shafts go. If there's no oil on anything, if you take it apart and go through Ron's procedure, you will get no change. If the oil was not visible, you may fix the problem. I'm hoping you'll not find anything bent, as that will be a lot harder to fix.

I otherwise had the usual issues of dirty contacts and having to re-tighten grounding screws.

They're nice receivers and a big improvement over the SW-4A, in that it has a BFO and thus USB/LSB/CW modes. You can listen to ham bands with it as well as all sorts of other SW BC.

If you still have the AC power cord, beware of where the plastic body meets the wiring on the rig end. I got a nasty zap from exposed conductors at the junction of the connector and the cord. There's no real fix for this other than cutting it off and either hard-wiring it or using Molex pins and clearly marking where everything goes!

Subject: Re: [DrakeRadio] SPR-4 problems

Geoff -

OK. Yes, the axle grease that Drake used 30+ years ago has long since
dried out. It also forms little rock-hard 'clumps' that can account
for some crunching or 'bumping' of the tuning, causing the receiver to
skip frequency. Best is to clean ALL the old grease out, then
re-lubricate with a drop or two of oil. it's not a 'high speed' or
heavily loaded bearing, so really doesn't need grease. There is also
an Allen head set screw at the back end of the drive screw to adjust
the bearing pressure. It should be tightened just enough to take out
any side play of theMAIN TUNING knob.

If the receiver has been dropped, it's possible that there is a slight
bend in the main tuning shaft.

The problem with oil on the nylon gears isn't visible, just a drop or
two of oil on the hub/shaft can swell them enough to bind. As you
found, if you disengage the gearing, the nylongears should spin freely
ontheir shaft..

Steve may have some more ideas, he's just been going through an SPR-4.
I've never had one, so a bit in the dark.

You will find more Drake expertise here than anywhere else! :-)

I guess that makes it easier. This one was brought here in the 1970's when someone moved here from the US and wanted a radio to listen to the BBC, etc. As far as I am concerned he made an excellent choice. :-)

It looks like it sat ignored in his shed for about 20 years, maybe longer. A little rust around the edges (mostly on screw heads) and except for the stuck dial and a banged up rear (which may have occurred later), it is in good shape.

When I first got it, I cleaned as much as I could with deoxit (the red liquid) very carefully. I also replaced the bulbs with LEDs and the rubber tuning buffer with gas hose.

Recently someone posted a link to vendor of drake specific parts and I replaced the LEDs with the correct bulbs and the rubber buffer with a correct one.

It has a few extra crystals, calibrator and noise blanker. I probably could remove them and sell them for more than the radio is worth (someone is selling the noise blanker for $250 and the crystals for $15 each on eBay), but the thought sickens me.

I was unable to find anyone local who fixes 4 line radios, but I may get an answer in a few days if someone knows someone who is not on-line.

If not, I asked a local ham who is an amateur machinist if he would be willing to do it.

> I otherwise had the usual issues of dirty contacts and having to

This one has 7, 14 and 21 mHz, but not 10m. 14mHz is off by exactly 13khz, so I expect it has a regular 4 line crystal in it, not an SPR-4 specific one. 3.5mHz is worthless here because of all the computers, etc. (it does not have it anyway)

Back when the BBC was beaming signals in this general direction, it was the most pleasant sounding receiver I have owned.

Steve -

I was just cruising through some old price lists of parts from Drake.
The uA923 was $20 as a repair part. The standard (SS) knob was $1.25
and the push-on was $0.45. Probably cost half that in production
quantities. $0.80 difference in material cost wouldn't seem to be
worthwhile on a $400 receiver!!?!?!

Garey,

If you have Dish Network, you might enjoy a program or two of space documentaries. They are on the Science Channel, I think and every time I see them, I think of your involvement and watch for you. Actually there are two of them, one goes from the early Mercury missions through all of Apollo. Lots of film in the Huntsville area as well as others getting the rockets to go up, not out, HI. The other series is about the machines of the space program. Both are EXCELLENT.

I'll try to remember to email when I see them coming on again.

I always associate push-on knobs with consumer radios.
Now, someone I think mentioned knobs rubbing on the panel.
Not sure if this referred to the push-on kind or the set
screw kind but one answer is to copy the old radios and put
a felt washer under the knob. Washers are available from a
couple of places that sell restoration parts for old radios
but they are very easy to make. I use a paper punch to make
the center holes. Haven't tried a leather punch but that
would probably also work.

Hi Don -

I have the Science Channel on ROKU. I'll have to check the schedule
and see what's up. I was there from late Mercury through Apollo 14.
August '71 I switched to Radio Astronomy at NRAO to look a little
further out with the VLA! :-) Wish I could claim the Hubble, I think
that's the'coolest'!

13793. Re: [DrakeRadio] SPR-4 problems

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-16 21:47:13 UTC
From: Garey Barrell
Topic: 13746 Message: 13793

I took a more scientific approach early on. Just stuff a wad of
solder up inside the knob before installing. Worked fine, but finally
just switched everything over toSS types.

13794. Classic Space Programs

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-16 22:03:39 UTC
From: Don Cunningham
Topic: 13794 Message: 13794

Garey,

One final post to help find the shows. The "series" was first shown shortly after Neil Armstrong's death. It was done all one day long, and I got a chance for once to settle in and watch it all in a string. I have just caught bits and pieces since. However, keep your eye out for a "marathon" space day again. Often done on holiday weekends (maybe Memorial weekend??).

Back to Drakes, hi.
73,
Don

Of course, one thing I did learn is that if you save a buck and you build 5000 units, you've saved $5000.

I can remember sitting in meetings when such things were discussed.

I put a nickel under each knob when reinstalling as a spacer. Of course, I don't draw it down too tight!

I'll briefly throw in the comment that the crystals are not compatible to the 4-lines. The SPR-4 uses the smaller size (can't remember the designator).

In the early 1960's $5000 would buy you a house, or a cadilac or a Jaguar.

I saw that - got the same email flyer.

I believe that's a Littelfuse 342014, possibly?
If not that identical part, then made-like.
There are VERY few of those out there - hard to find indeed.

I believe http://www.ralphselectronics.com
still has the 'knurled' styled cap version of this, but out of stock
on this particular style cap.
Talonix.com is now out of stock at $1.42, so I guess the $4.95 is
now a bargain.

The 1/2 inch hole is particular. I just fixed a broken fuse holder
in a Curtis EK-39, and there is NO ROOM to drill that out to fit
the now larger fuse holders.

Plus it has the old look.

Hello all,

Despite indications to the contrary, my call is not M6TGT, its 2E0TGT its just that Yahoo won't let me update it!!!! Anyway, greetings to you all!!

I've just got my hands on a very sweet looking Tono 9000E Comms Terminal - yep, a bit old in computing terms but I like retro stuff, its rather like me in many ways lol (somewhat temperamental, occasional malfunctions and getting less tolerant as the years progress).

My only problem with it, is a lack of manual, the link that was posted some time ago on this site is no longer functioning, so this is a bit of long shot: Does anybody have one which the could copy for me please or have any idea where I may get one??? Please don't mention Dayton - I'd love to come but really cant afford the air fare at the moment :) I'm more than happy to cover copy and postage fee's.

Many thanks. Lin 2E0TGT 73's

Yup. especially with parts that are handled by the user. components can be changed for efficiency or cost with nobody the wiser (except for folks like us...). Still, I'd be willing to bet that a lot of folks who bought these rigs new didn't even notice!

I think you are looking at it the wrong way. Although planned obsolescence was decades away, cost cutting was still on designer's minds.

Looking at it in hindsight, the last SPR-4 was made in 1976, by 1992 they were obsolete. Not obsolete in terms of being ready for the junk pile, but obsolete in terms of technology features and price.

So if you consider that they were good solid technology for at least 16 years before being eclipsed by frequency synthesizers, high quality filters, synchronous AM detection, digital frequency display, computer control, etc. it was a very good run.

The fact that we are here almost 40 years later complaining because a knob might fall off is a testament to the quality of the design and construction of these radios.

Geoff.

Hi Mike,

Welcome! You might find an AC-4 power supply as there are lot of guys on this reflector. There are usually a few on Ebay also.

If you get an original one (original caps in the supply), I would recommend installing one of the aftermarket upgrade kits. These kits have all new components on custom PC boards and fit right in the AC-4 supply.

The ones that I have started using are from Paul, K0UYA, who is a member of the this Drake group. I have installed one of Paul's kits in the supply for my B-line and have another to install in the supply for my C-line.

Paul's Email address is elespe@...

He can send you a link for some pix of his upgrade boards installed in an AC-4.

GL with the 4-line. Is it an original R4/T4X or a newer A, B, or C-line? Just curious...

73, Stew K3ND...

Absolutely! One reason I have this drake "problem" is because I'm of the opinion that they were mostly well-designed high-performance radios that are still quite useable today on ssb and cw.

Even swl isn't what it used to be, but the SPR-4 acquits itself quite nicely.

13810. Wobbly tuning knob and dial on R4B

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-19 05:45:22 UTC
From: Richard Knoppow
Topic: 13810 Message: 13810

The tuning knob and dial on my R4B wobbles. It has play laterally. There appears to be an adjustment for end play on the shaft but I can't see how to do it. I think Garey just answered someone with a similar problem. The tuning shaft appears to be held at the panel and by a ball bearing and at the other end by a single ball. I can see what looks like a threaded collar at the back end but when I looked for a place to adjust it couldn't find anything. What am I missing? This is a fairly early receiver with metal gears.

Hi Richard,

It was me that asked recently. Mechanically they are all similar. That threaded collar should be an allen head screw.Take off the aluminum cover. There is a brown phenolic board held on to the gearbox with screws and spacers. There is a hole in the board material for you to insert an allen wrench. Some have said it uses a 1/8 in allen wrench, another source said 3/32 in. Mine was 3/32.

Richard -

Should be a 'cup' Allen head setscrew at the back end. There's a LOT
of room, so I don't think the screw fell out. Reach in with your
Xcelite!! Sorry I don't recall which size. Tighten just enoughto
take out any side play.

Thanks Garey and others, I looked using a dental mirror
but couldn't see the Allen socket. I will give this a try
later. The wobble has been there since I got the receiver
but its annoying and the companion transmitter is perfectly
solid.

William Houghton was right, its 3/32. I used an
extra-long L wrench with a ball tip. Took maybe half a turn
to make it solid. Thank you all.

> nicely.

That's because SWL is not what it used to be. During the first "Gulf War" SWL'ing became a boom industry. Radios were flying off the shelves at places like Radio Shack.

Even before them, in the late 1980's the bands were so crowded that better solutions were made to separate the stations. AM stereo had bombed by that time and manufacturers were stuck with warehouses full of AM stereo decoder chips.

One brilliant engineer at Sony took an ICF-2001 digital SW receiver, added air band, more memories, and improved the synthesizer. But his real stroke of brilliance was to take the AM stereo decoder chips and use them for shortwave reception.

One of the AM stereo systems transmitted the left channel on one sideband and the right channel on the other. On a regular AM receiver, you heard both in mono. If you had a sideband splitter, you got stereo.

Instead of using the sideband splitter for AM stereo, they sold it as a Synchronous AM detector where you chose the sideband. So if two stations were too close together, you could listen to one sideband of the station you wanted.

This radio was called the ICF-2010 (or ICF-2001d outside of the US) and I still have one. In fact, one very impressive thing about my wife when I first met her, so did she.....

Later receivers tried other things, such as the Kenwood R5000 which had a choice of wide skirt AM filter or a narrow skirt one (about $100 more). Mine had the narrow skirt one and a special 4kHz narrow skirt AM filter when the 6kHz one was too wide.

I had that radio until 2 years ago when I failed at replacing the main filter capacitor due to eyesight problems and burned out the power transformer and power supply board. Someday it may be resurrected.

I also had an NRD-535D (which I sold in 1996 when I moved here), which had an AM synch detector which worked poorly. It would easily lose lock, and howl. It also more importantly had a variable bandwidth IF filter,

so you could crank it down to the point that nearby stations were no longer heard, hopefully you would still be able to hear the station you wanted.

But these days, none of that is necessary. There are so few stations on the air that wide skirt filters are good enough, and the wider the skirt, the more pleasant sounding the audio is.

So while SWL reception was probably unusable most of the time on an SPR-4 around 1990, today they are wonderful.

Geoff.

Well, that works but I would like to leave the anti-vox
set at a correct level for SSB rather than having to change
it back and forth. It may be that in my particular set up
the anti-vox has to be set higher than usual.

13820. Re: Tuning the T4X

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-19 19:52:46 UTC
From: dohafisher
Topic: 13313 Message: 13820

Tnx Garey for the help, finally got back on the T4X, here's and update.
All the resistors were OK. I noticed you said failure to dip could be caused by a bad antenna match, or coax. Also when I was trying to tune up, when I wud switch to the T4X pwr meter, it was showing output, but none on my external pwr meter. I soldered a coax on the ^JB6 side on the antenna relay, and was able to tune up. I had abt 140 watts out, at 350ma current. Don't know if my relay is bad or just not activating.
I measured voltage on the V-10 side of the relay in SSB 268, in TUNE 275. I also measure the voltage on the other side of the relay SSB 275, TUNE 208. I then inserted a ammeter between V10 and the relay, in SSB 10.1ma, in TUNE 9.9ma.
Can I turn the T4X on it's side and key it to see if the relay is moving, or would that cause problems. How can I tell if the relay is actually activating when I key it? If the relay is bad, do you know where I might be able to get a replacement, and is it as bad to get out as it looks?

Thanks
Doyle

Perhaps you need a more directional mic!! Or turn down the receiver
audio. Or move the mic from in front of the speaker!! Or stay on CW!!!!!

For CW I just leave the receiver in ON and listen to my real signal.
My keyer has a monitor, but my Vibroplex doesn't!

Geta TR-7....... :-)

Doyle -

The relay has to close to key the transmitter. But you could have a bent or burned contact.

Let's make sure we're talking about the same things here before we go too far. You're saying that you were able to solder a coax on the PA side of the antenna relay and get a nominal, full output. Forgive me if I get too basic, but have you examined the wiring from the relay to the ANT connector onthe chassis? Is the connector in good condition? How about the connector(s) on the cable from the ANT connector to the wattmeter?? the attached page identifies the various relay contact sets and their function.

Your voltage readings are not quite clear to me either. The point of interest is Pin 6 of V10. You should see about 260 VDC or so in SSB, relay de-energized, and about 200 VDC in TUNE, with relay energized. In SSB, with the PTT closed, Pin 6 should again read about 200 VDC, and the relay is energized. You should be able to clearly hear the relay close when switching from SSB (no PTT, GAIN at minimum) to TUNE.

Yes, the relay IS a PTIA to replace. There is one very effective way to do it at<http://jessystems.com/R4B-T4XB.html>. Drake also offered a small pc board to mount a socket for the same relaythat is used in the later C-Line pieces, but they are no longer available. I have the information, and have considered making a few boards, but just another one of those projects.

I would suggest a close inspection of the relay itself, and special attention to the ANT switching contact set. Don't forget the cables mentioned, bad cable have bit more than a few of us!!

The CDs are available and described on my website at <www.k4oah.com>. Paypal to <k4oah@...> is fine, as are check or mo. Specify which one(s) you want.

13824. R-4B mute problem

From: mammolistefano
Topic: 13824 Message: 13824

Hi all

My R-4B is started to have some mute problem, when i trasmit with his T-4XB twin it does not mute well, and while trasmitting I can hear my voice low on the speaker mixed with some ac, if I reduce the af gain it disappears, I first subtituted the 8 microfarad electrolitic capacitor on the bias, but nothing, i found that if I switch on the avc off position the problem disappears, the bias voltage is correct on TP2.
Any suggestions

Are you sure it's a mute issue?

Could be as simple as rf getting into the audio/power supply lines.

Stefano -

Several possible problems.

First - Is the FUNCTION switch on the receiver in the EXT MUTE or NB position?? If it is in the ON position it will NOT mute.

The MUTE functions my 'unshorting' the MUTE jack on the receiver. Grounding this jack 'unmutes' the receiver.

1. Unplug the MUTE cable at the receiver end and see if it's completely muted. If it IS ...
Plug it back in and unplug the transmitter end. IF it's still muted when you unplug the transmitter end, the problem is in the transmitter.

2. If it is NOT muted with the cable unplugged at the R-4B end, the problem is in the receiver.

3. A bad (shorted/leaky) cable will unmute the receiver if plugged in ONLY at the receiver end.

4. About the only problem in the transmitter is a severely bent or broken relay contact.

5. If in the receiver, either a shorted wire or slight possibility of a leaky C205.

Voltage at TP2 should go to about -35 VDC when receiver is MUTEDand S-Meter should be at ~full scale.

The side tone from my T4XB is pretty loud. Is there any
way to adjust the level? Some component change maybe.

Got this R-4B back together and gave her the ol' smoke test. Nothing smoked (always a good sign) but the S-meter was stuck about mid-scale, and varying the RF GAIN and the various AGC, S-METER ZERO and receiver gain did diddley. I could hear the calibrator and background noise. Hmmm. That's strange.

No voltages at all at the RF GAIN pot. In fact, lots of 0V readings all over the place. Ruh-roh. Checked the power supply and there was no -80 bias supply. Ah - Eureka, as they said in the Grecian language. Turned off the rig and ohmed the -80 supply to GND.

Shorted.

Must be a bad diode. As I tilted the board on which the diode and capacitor are located, I saw something shiny and round roll out from underneath. There was a solder blob shorting the diode to the chassis.

Moral of the story: keep track of your de-soldering! I had replaced the capacitor with a new one and apparently the solder-sucker's vibration shook the molten solder off the board and deposited it on the chassis, where it rolled to just the perfect spot!

I am using an Electro-Voice 664 but its too close to
the speaker. The MS-4 is on a shelf over the RX and TX.
This is not a major problem but I thought there might be
some simple way to do it. I am going to start working CW
again. Haven't for years and its taken me a while to get my
confidence up. After listening around I think I am actually
ahead of the game. The twins seem to make a very good CW
rig.

Half a turn is quite a bit, so I'm not surprised it was sloppy.

You should be able to turn the knob with your index finger when the tension is right.

Yes, it's a pain to change the relays on the pre-C transmitters. You may be able to clean the contacts - carefully! - with contact cleaner and a crisp dollar bill between the contacts. Be REALLY careful!

13832. my latest TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-20 18:52:11 UTC
From: William Houghton
Topic: 13832 Message: 13832

Hi Garey,

I measured the output on the ends of the various bands into a dummy load. I'm getting 150W to 160W at some ends. In all cases there is a noticable drop from one end to the other. For example 80m ranges from 150W at 3.5MHz to 110W at 4.0MHz. I'll have a better feel for it after I align it.

The cathode resistors are all about 17% high at 17.5 ohms. Not sure how much that affects the output power.

Now to try to bend the PTO's brass tuning rod straight unless someone has a working TR-4 PTO available -hihi.

73,

Bill

Bill -

OK, that's not bad. Fully aligned with new PA tubes, you should see
about 200W on 80-20M, 175W on 15M and 150W on 10M.

The Cathode resistors eat into your power somewhat. They need to be
close to 15 ohms, ideally within 5% of each other. They're there to
equalize the current through the three tubes. If the voltage across
one resistor goes up, the Cathode voltage goes up, which makes the
Grid slightly more negative, which reduces the current throughthat tube.

You'll probably be fine once you get the alignment done. Good luck!

13834. Re-initializing the PBT assembly

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-20 22:46:30 UTC
From: Steve Wedge
Topic: 13834 Message: 13834

I've done a Very Bad Thing.

While tuning the PBT slugs, there was one that didn't seem to be peaking, so I kept turning it. Things got worse. I tried returning it and re-peaking everything.

I think you know the path I've gone down: one that a good tech isn't supposed to take. I will allow that this R-4B had been fiddled with before I got it. I had almost finished doing the alignment when this happened.

The slug rack and the cam were cleaned and re-greased.

How did they initially set up this thing at the factory? Am I correct in assuming that the distances from the plate to the slugs does not necessarily have to be equal when it's close? I say this because when I tried setting them up this way, the threaded ends were not equal at the rear plate where the holes are. I will assume I need to start with the rear "threads" nearly equal relative to the rear plate.

The schematic depicts the selector as variable capacitance. It appears I can start peaking the slugs in the 2.4 position, I get a little better in 1.2 and by 0.4 it all falls apart.

It also appears that I can't get the lower-left slug to turn out - which is what started the trouble to begin with.

Any suggestions welcome.

73,

Has anyone else gotten in this deep?

73,

Steve Wedge, W1ES/4

Topic: 13729 Message: 13835

Thanks Garey and Jim!

Jim - I've gone through and re-cleaned the Molex pins and sockets on the translator board with no joy. Used straight Deoxit and the contacts. I also cleaned up the bandswitch contacts as it was a bit intermittent - they were gross! A little Deoxit on a Q-Tip works miracles.

I'm aware of the repro extender boards, but I can't afford to buy a set at the moment - Need to sell more junk on eBay! Lol...

I checked all of the tantalums on the translator board and they test fine. I think I'm just going to order the four ICs in that circuit and all of the tantalum and electrolytic caps in the radio and get to work. I've had run-ins with shorted and exploded tantalums, so I'd rather know that there are new ones in the radio - especially since I'd like to use the radio on a daily basis.

Garey - Thanks for the file! I've come up with a similar sheet while troubleshooting this problem. It seems that the DR7 is sending the right bits to the translator, so there must be a stuck bit on one of those chips.

In the mean time, I've been working on cleaning out the gummy grease on the PTO ball bearings. Is there an easy way to do this without taking the PTO apart? I have the PTO out of the radio already.

Thanks again for your help!

73,
-Greg K2GTM

Are you talking about adjusting the height of the slugs on the transformers in the PBT rack?

Sounds like "you's in a heap a' trouble, now" Steve.

You need the advice of Drake Guru Garey.

Subject: [DrakeRadio] Re-initializing the PBT assembly

I've done a Very Bad Thing.

While tuning the PBT slugs, there was one that didn't seem to be peaking, so I kept turning it. Things got worse. I tried returning it and re-peaking everything.

I think you know the path I've gone down: one that a good tech isn't supposed to take. I will allow that this R-4B had been fiddled with before I got it. I had almost finished doing the alignment when this happened.

The slug rack and the cam were cleaned and re-greased.

How did they initially set up this thing at the factory? Am I correct in assuming that the distances from the plate to the slugs does not necessarily have to be equal when it's close? I say this because when I tried setting them up this way, the threaded ends were not equal at the rear plate where the holes are. I will assume I need to start with the rear "threads" nearly equal relative to the rear plate.

The schematic depicts the selector as variable capacitance. It appears I can start peaking the slugs in the 2.4 position, I get a little better in 1.2 and by 0.4 it all falls apart.

It also appears that I can't get the lower-left slug to turn out - which is what started the trouble to begin with.

Any suggestions welcome.

73,

Has anyone else gotten in this deep?

Don't I know it, Bill.

It appears that the crux of the problem is that the bottom-left (when looking from the back) slug will not move in or out. Adjusting the upper-left slug does very little.

I tried dialing-in all of the slugs at the 1.2 setting and was able to peak the two on the right. I was starting to think that maybe they're switched in series, but apparently, it's just the coupling between them that is changed. The schematic isn't really helpful. I haven't looked on the CD yet, so that's my next step.

If I adjust the centre screw so that I have the same sound at 9 o'clock and 3 o'clock, with the selectivity at 0.4, I was able to peak the two on the right. I'm starting to think the switch or a capacitor might have gone bad.

Signal attenuation really begins at the 1.2 setting and is downright awful at .4.

I'm calling it a night with this. Anyone got a PBT assembly?

From: Steve Wedge
Topic: 13838 Message: 13838

I took the R-4B's slug rack out again and noticed the one that wouldn't adjust was turning the plastic sleeve in the metal bracket. I carefully held the sleeve with some needle-nose pliers and turned the slug.

Success!

Put everything back and it's all working a lot better - except it seems to me that the upper-left coil doesn't peak as sharply as the others. Still thinking there's something else not right here...

Time to really call it a night. Really.

Hi Garey,

After alignment I now get:

80m: 160W at both ends
40m: 140W to 160W
20m: 150W to 160W
15m: 120W to 130W
10m: 130W to 140W

with the somewhat high cathode resistors giving slightly more negative feedback
than intended. Not knowing the age of the finals I am pleased with these
results.

73,

Bill

Bill -

OK, that's not bad. Fully aligned with new PA tubes, you should see
about 200W on 80-20M, 175W on 15M and 150W on 10M.

The Cathode resistors eat into your power somewhat. They need to be
close to 15 ohms, ideally within 5% of each other. They're there to
equalize the current through the three tubes. If the voltage across
one resistor goes up, the Cathode voltage goes up, which makes the
Grid slightly more negative, which reduces the current throughthat tube.

You'll probably be fine once you get the alignment done. Good luck!

Yeah, I was getting tired last night and did find a procedure on the CD that differs from what's in the manual. The CD procedure looks like it's a bit simpler.

I think this one was "out" when I got it - probably due to a PO trying the same things I did but being afraid to take apart the slug rack. As soon as I got the rack out, I could immediately see what the problem was. Once the slug was freed relative to the plastic sleeve, it turned freely.

I still have a little concern about that top-left slug. Adjusting it just doesn't seem to do very much: it's VERY broad, which suggests to me that the Q of that one part of the circuit is low. I'm hoping it's not a bad capacitor, as these caps all seem to have color codes on them - suggesting they were matched. Do you have any insight as to how they assembled and tested these assemblies?

Right now, I am listening to A35JP on 20 CW with the 400 Hz filter and he's quite hearable; the selectivity is okay. Sounds about as strong as on my K3 (he is pretty weak and is a pretty good test for a weak signal - and, yes, I worked him...).

Aside from this problem, the calibrator and the hum, this receiver was okay and now is working a lot better. The calibrator doesn't seem to be as strong as on my other B but it's useable. I did abuse that coupling cap while working on it (it's also the "jumper"). All the hum is gone after doing the can cap yesterday.

Ah, well - I'll have more time to play with this later this evening. I'll try the CD procedure then.

Bill -

That's typical of a TR-4 with 'used' finals. Output power of 'new' finals reaches these levels in a year or so, depending upon brand, etc. ..... However, once they get to this level they tend to last a LOT longer with reasonable care.

The relative values of those cathode resistors is more important than the absolute value. If you're tired of working on it, add some Ohmite OX ceramic composition resistors, or if you can find 'good' 2W carbon comps, and have them on hand for the next time you're in the mood!! :-) Metal or carbon 'film' resistors are not a good choice, as they don't care for current surges like these see.

Congratulations!!

OK, so I'm new at this, and just learning how to tune a tube transmitter. Have been following the steps in the manual and I think I have it right. However, just looking for some confirmation that things are not out of whack and I might mess up the rig.

I also realize that every system is different, so there are no hard and fast "correct" values. However, after tuning for both 20m and 40m, I ended up with a Plate setting of around 7-8 and a Load setting of around 3.

Does that sound about in the ballpark for what others that own this model transmitter end up with when tuning?

Those are reasonable numbers. The only way to get 'comparable'
numbers is if you load into a good dummy load. Otherwise, variations
in antennas candisrupt 'correct' numbers.

TUNE mode, dip PLATE control, increase LOAD control, alternately,
until increasing LOAD control no longer results in an increase in
output power. The GAIN control should increase power smoothly, and
'top out' around 4-5. This is the ALC taking control. CW operation
may require advancing the GAIN control, sometimes considerably, for
maximum output. Key factor is _keep the PLATE control dipped for
minimum current_. Should be the first and last adjustment made.

13849. R-4any S-meter

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-21 17:29:41 UTC
From: Steve Wedge
Topic: 13849 Message: 13849

I've arrived at the conclusion that the S-meter in this R-4B has got some mechanical problems. Right now, with the receiver off, the meter is reading S-2 and it hardly indicates anything at all unless there's a super-strong signal present.

I'm tempted to work on it but I'd rather buy one first so if I mess with it and screw it up, I don't have a perfectly good receiver with a junk meter in it.

Anyone got one for sale?

Alternatively, I can't remember if this has been brought up before or not, but has anyone found if the transmitter meter is the same movement - and, if so, how hard is it to get the cover off so I can swap the scales?

I know Garey has mentioned that these meters were super-cheap when Drake bought them, so I know I'm not dealing with something that's likely repairable...

Steve -

The good news is that the S-Meters are all the same, from the 2-B through the R-4C.

The not so good news is that the T-4X meters seem to be of two types. One sort is easy to open, the other is impossible! Also, the T-4X and early T-4XB meterhas a 0-400 mA scale, later B's and C's have a 0-500 mA scale. Both movements are the same, 0-3 mA fs.

I thought so, as it would make sense from a production standpoint. (Then I start thinking about those setscrew-less knobs and do a facepalm...)

I have a meter from a T-4XB, so if I can get that case open, I'm sitting pretty...

Thanks,

Steve Wedge, W1ES/4

I quickly hooked up the T-4XB meter I have and it's definitely behaving better than the meter that's in the R-4B.

First strategy will be to carefully pull apart the R-4B meter, if I can. If it won't come apart, I'll try taking apart the T-4XB meter. If I can get that one apart (and it looks like it will), I'll risk cracking the R-4B meter to do a scale transplant.

Thanks for the advice, Garey. I sorta thought they had the same guts, but it doesn't hurt to ask...

Steve,

Are your meters like the 4 line that have two screws that go though the plastic case? If so they are easy to take apart. You have to be very careful with the enamel wire loops that come out toward the meter front. If you don't know they're there they're hard to see.

Swapped scales and both meters are still intact. The sluggish movement will probably be okay on a transmitter someday, should I need it.

Losing 2 - 3 S units with the 400 Hz filter, so something's still not right there.

Has anyone diagrammed which of the parts on the BPF board go with which coils? I'm still suspecting a bad part associated with the top-left coil (as viewed from the rear).

The plastic covers of both meters came off easily with a jackknife and a little finesse. You break the glue-line first.

Everything else was a quick swap!

Just opened the CD again. Sorry for the oversight - the schematic for the BPF assembly is indeed at the end of the R-4B manual! That's one extra that's much appreciated right about now. I was looking in the "B-Line Service Manual" because I was assuming it was a straight re-print with no additional pages

Re-ran the procedure from the CD and the top-left is definitely not peaking. I get to a max negative voltage as I turn the slug inward but it never peaks. The tuning at ".4" is definitely sharper than "1.2" but there's 2 S-units of loss at ".4" relative to "1.2".

Looking at S1B (rear) on the schematic - is that switch moving about 22 degrees with each detent, or 45? In other words, all capacitors in the filter are starting out connected together and grounded (and enabling all of the sections). When I move the switch to "1.2", am I correct in saying that C5/C8 get disconnected but C3/C7 remain grounded? It makes sense to me, since the signal appears to be going through S1A and through L3 and out when the band pass is fully widened.

Yep - I'm going to meter it anyway.

It looks like S1A is matching the input of the network, successively switching in more parallel resistance as your bandwidth is increased and also disconnecting L3 from C4 at "2.4" and "4.8".

Based on my symptoms, it looks like I'll start around S1B, R1/C1/C2, C5, 8, 10, 13, 17 and 20, with the problem probably around C1/C2/R1

If I rip this apart, I'll take pics.

13859. Re: [DrakeRadio] R-4any S-meter

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-22 13:00:15 UTC
From: Steve Wedge
Topic: 13849 Message: 13859

No photos, but I'll describe what I did.

1. Remove meter from radio. Do this by clipping the wires to the meter leads. DO NOT UNSCREW THE METER CONNECTIONS FROM THE BACK OF THE METER. There are two screws/nuts that hold the meter bracket to the chassis. The nuts are 1/4" and the screws are close enough to the edge in both places where you can hold the screw with a jackknife blade, if necessary, to keep the screw from turning.
2. With a knife, score around the perimeter of the back where the plastic meets the metal back of the meter.
3. Carefully get the knife between the plastic and metal and GENTLY work your way around the back. The two pieces should begin to separate. Pay attention to the meter face to ensure that it stays with the metal base and doesn't get pulled up with the plastic (and bending the pointer).
4. The plastic front should pop off without forcing it and without cracking the plastic. If you have a meter that doesn't meet the description here, proceed with caution!
5. The white plastic "pegs" that cover the metal pegs may fall off. They're less than 1/4" long, so be careful. Set them aside.
6. Remove the two screws that hold the face to the movement and remove the metal pegs that are held down by these screws.
7. Carefully remove the meter face. Be aware that you'll have to slide it "up", then lift the bottom to clear the pointer. Avoid touching the pointer as much as possible.
8. Installation of the face is the reverse of removal. Make sure the pegs are near the upper corners of the opening at the bottom.
9. With the meter facing up, carefully press the plastic front back onto the metal body. You'll need to go around, using your thumb and forefinger. The plastic will snap into place.
10. Reinstall the meter and its bracket to the chassis. Do this before attaching wires!
11. Desolder the connectors on the rear of the meter and remove the wire ends. Strip the wires you cut and re-solder to the meter terminals.
12. Admire your work and fire-up the rig!

13862. PBT Preliminary findings

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-22 16:08:49 UTC
From: Steve Wedge
Topic: 13862 Message: 13862

I've identified the inductors. Looking from the rear:
Top Left = L1
Bottom Left = L2
Top Right = L3
Bottom Right = L4

I've removed the side cover from the left side to expose L1 and L2. The coil has continuity. Because this thing is such a pain to disassemble, I'm tempted to change C1, 2 and 3 but will refrain from C3 right now, as it looks like a SAT part (it has paint on it).

Now, to find a 1030 pf SM cap...

From: jdouglasrichardson
Topic: 13863 Message: 13863

This is a first post after lurking here for a while, trawling through the old posts re TR4s.
This radio is the better one of a pair I found at Nearfest earlier this May. The second set may end up as parts unit but except for missing its crystals is complete. They both are pretty scruffy but have pretty good front panels. This post is dealing with set serial #28594A.
Anyway...
First order of business was to get a copy of the K4OAH service CD for the TR4. It has been invaluable so far.
At this point heres what I have-
Receive is great on all bands.
Output is at specs on all bands, which was surprising to me.
However it won't tune on LSB on 80M. By not tuning I mean there is no rise in plate amps when in x-cw mode while sweeping the rf tune control. It will pick up the load as normal in USB.
40M tune is normal, LSB, ~ 200w carrier out. (uncalibrated Heath wattmeter but at good for relative readings) Good on air reports.
20M tunes normally USB. Good reports as well.
15M and the three 10M segments will tune only on LSB, same trouble description as 80M.
Had good reports today on 29.070 AM with this set.
I'm leaning towards a full alignment.
The CO crystal is from 'stock' (read junkbox) and dips on my MFJ 259B antenna analizer at 8.997 as best I can see. I replaced it because the original crystal lead was broken off flush with the crystal body.
Is there any hope for the old girl? I think there is but I could use some input.

Hi Jim,

"However it won't tune on LSB on 80M"

It's not supposed to. It will only tune on CW or AM when the SSB switch is in the "X" position. You might note that the CW position is labelled "X-CW" to remind you of this. So tune it up on CW with the SSB switch in the "X" posiiton and then switch to the SSB you want.

73,

Bill

Hey, Jim -

Easiest first: the crystals are available from a number of sources, ICM, JAN and one in the UK called QuartSLab.

If you need more than one, the one in the UK may actually cost less.

It sounds like one of your crystal filters is bad or is not connecting. 80m on these radios is "upside-down" in the IF.

Steve,

Since it receives fine on all bands its doubtful he has any issue with the xtal filters since it common practice to use LSB below 10MHz and USB above 10MHz.

Both the TR-4 and TR-4C produce a CW carrier by adding a DC bias to the balanced modulator allowing the 9MHz signal to pass through. This only happens when the SSB switch is in the "X" position. The X position is USB on 80m & 20m and is LSB on 40m, 15m, and all of 10m. This exactly matches Jim's observations of which sideband he can tune up on.

I don't know about the T4X(any) because I haven't used them.

Bill -

I was not as confident based on his description, but I believe you are correct. I would have called it TUNE, for that reason! :-)

The T-4X(any) IS different. The Mic amp is converted to a phase shift audio oscillator around 1 kHz and injected into whichever sideband filter is selected, so it will TUNE on either one.

The Carrier Oscillator IS shifted for CW and AM into the LSB filter on these, and the BAL MOD is unbalanced with a DC bias.

13868. R4B challenge

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-22 22:13:57 UTC
From: w7jpg
Topic: 13868 Message: 13868

A R4B followed me home from a local swapmeet. Looked like it would present a challenge but the price was right and I need the practice. Call me a Wedge wannabe.

I am currently preparing a list of observed issues to share with you all. However, I am jumping the gun a bit because of an issue I discovered that may be my Waterloo before I even get my fingers dirty.

After some basic preparation of the radio for power, I brought it up slowly on a variac. No smoke! whew...!

First discovery was that the RF gain control was a replacement and is broken although was usable enough to get some noise. Audio is working, at least to let me hear a hum along with the noise.

I proceeded to see if the receiver would cooperate and hear some signals.

After trying a couple of bands, twisting the preselector control to get some noise peak (no noise peak), I quickly realized the preselector knob was twisting but the entire preselector assembly was not moving so the slugs weren't moving. I tightened the knob and tried again. The knob rotates because the vernier (?) is allowing it to rotate but the shaft on the other side of the vernier is not moving. I hooked up a shaft extension to the rear of the preselector shaft, put a knob on it and gave it some torque. No rotation. Applied enough torque to realize the shaft wasn't going to twist. Surprising that the two dial cord assemblies could resist the torque and not slip even if a slug was frozen.

Looked at the slug rack assembly and compared it to a healthy R-4B sittin them "side by side". The entire slug rack assembly of the swapmeet R4B appears to be "tilted" by a couple of degrees to the rear compared to being squared up with the chassis as the healthy R4B.

Each of the slug adjustment screws for T-1 through T-4 on the swapmeet R4B is corroded (rusted) at the point where they pass through the adjustment nut. A couple of the adj. screws are slightly bent above the nut. (appears to be a common affliction as one is slightly bent on the healthy R4B.

I have searched without success for any posts in this list(and elsewhere) that discuss this particular problem.

I am assuming that the entire slug rack mechanism could be frozen up if any one (or more than one) of the four slugs are frozen. Fair assumption? Or is it unlikely the slugs are frozen?

After RTFCD service manual, operation manual, etc., I found nothing on disassembling the preselector assembly. Tt looks doable but daunting, especially in light of the rust encapsulating the slug adjustment screws.

Am I the proud owner of a parts rig or is there someone that has conquered this problem and can share their successful R & R technique?

All responses will be appreciated.

First correction to the subject message. After sending my message, i could not resist going back to the source of my frustration.. this time aided by my Optivision lenses. The good news is that the lens magnification revealed just how bad my eyes are. The slug adjustment screws are not corroded as I stated in my message. As many of you already know, they are covered with some type of plastic/rubberized coating (rust colored, btw) to presumably prevent rust. Also the Optivision revealed the "dial cord" is really "dial cable" which would indeed resist a LOT of torque if slugs are frozen or some other yet undiscovered force has caused the shaft to seize.

From: jdouglasrichardson
Topic: 13863 Message: 13870

Well,it looks like Bill nailed it.
Maybe I should work on my reading comprehension re the operating manual.
Made several contacts across the pond on 15M USB late this afternoon and and will be doing further operating later tonight.
I was suspecting the filters, in fact I swapped them earlier with the other radio which made no difference.
Next comes the major clean-up and de-tobacco residue-ing. The chassis will never win any beauty contests.
The other TR4 will be more of a challenge and I'm sure there will be
more questions.
This SSB mode may catch on.
(Except for the Kenwood TS830 the Drakes are the newest gear in the shack).
Thanks to all for the help.

13871. L-4 Amplifier Maintenance

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-22 23:23:20 UTC
From: slowcountry1
Topic: 13871 Message: 13871

As I have completed my TR-4 and TR-4Cw projects, I am turning my attention to my beloved L-4 amplifier. About 8 years ago, I rebuilt the power supply with new capacitors, upgraded diodes and bleeder resistors. I have recently replaced the foam seal material in the bottom of the case and added fans to move air through the power supply.

Are there any other components that should be replaced or given attention? I am running, what I assume to be, the original 3-400 1968 date code tubes; full output appears at 900 watts.

As a side note, I do not have any type of soft start for the amp. I do not use the power switch on the amp, I use the 220V breaker in the panel for turning the amp on and off.

Thanks,

Doug - N9XTF

Subject: Re: [DrakeRadio] TR4 recomission

Steve,

Since it receives fine on all bands its doubtful he has any issue with the xtal filters since it common practice to use LSB below 10MHz and USB above 10MHz.

Both the TR-4 and TR-4C produce a CW carrier by adding a DC bias to the balanced modulator allowing the 9MHz signal to pass through. This only happens when the SSB switch is in the "X" position. The X position is USB on 80m & 20m and is LSB on 40m, 15m, and all of 10m. This exactly matches Jim's observations of which sideband he can tune up on.

I don't know about the T4X(any) because I haven't used them.

73,

Bill

Subject: Re: [DrakeRadio] TR4 recomission

Hey, Jim -

Easiest first: the crystals are available from a number of sources, ICM, JAN and one in the UK called QuartSLab.

If you need more than one, the one in the UK may actually cost less.

It sounds like one of your crystal filters is bad or is not connecting. 80m on these radios is "upside-down" in the IF.

Subject: [DrakeRadio] TR4 recomission

This is a first post after lurking here for a while, trawling through the old posts re TR4s.
This radio is the better one of a pair I found at Nearfest earlier this May. The second set may end up as parts unit but except for missing its crystals is complete. They both are pretty scruffy but have pretty good front panels. This post is dealing with set serial #28594A.
Anyway...
First order of business was to get a copy of the K4OAH service CD for the TR4. It has been invaluable so far.
At this point heres what I have-
Receive is great on all bands.
Output is at specs on all bands, which was surprising to me.
However it won't tune on LSB on 80M. By not tuning I mean there is no rise in plate amps when in x-cw mode while sweeping the rf tune control. It will pick up the load as normal in USB.
40M tune is normal, LSB, ~ 200w carrier out. (uncalibrated Heath wattmeter but at good for relative readings) Good on air reports.
20M tunes normally USB. Good reports as well.
15M and the three 10M segments will tune only on LSB, same trouble description as 80M.
Had good reports today on 29.070 AM with this set.
I'm leaning towards a full alignment.
The CO crystal is from 'stock' (read junkbox) and dips on my MFJ 259B antenna analizer at 8.997 as best I can see. I replaced it because the original crystal lead was broken off flush with the crystal body.
Is there any hope for the old girl? I think there is but I could use some input.

Chris -

Check the vernier drive. First, it should be pinned in place to the chassis so that it doesn't turn. Secondly, this is a ball-drive and it relies on the friction in the heavy grease normally used to lubricate it to allow the output shaft to move. If you're lucky, someone before you thought they were doing a great thing by wiping up all that "nasty" grease and giving it some nice, light 3-in-1 oil.

That's the wrong thing to do and will give you results similar to that old urban legend about the Rolls-Royce engineers polishing the innards of the GM automatic transmission they outsourced - only to find the thing wouldn't work, either. Both stories rely on friction.

If you don't see grease, you may have to take it apart and put some nice, heavy wheel-bearing grease in there. Be aware that many of these have open fronts and at first glance they look like they ought not to work at all.

You might be able to find a ball-drive around if it's hosed.

The RF GAIN pot is easily replaceable with a Radio Shack (really!) part. The shaft on the RS part is way too long, but you've got a Dremel, right? I returned three R-4B's to service that needed those pots replaced and replaced them all with the RS part. Just match up the length and cut before installing...

I've heard that you don't want to use automotive wheel bearing grease on these because of some of the "stuff" that they put in it. I've used Phil Woods Bicycle Grease on Jackson drives in the past with good results. I've also used Triflow PTFE-based bicycle gease on a couple of drives out of a Swan rig.

The procedure was to remove the drives and spray/soak them with brake parts cleaner. You may need to work the mechanism a bit to break up any hardened grease - don't disassemble, you will probably regret it. The new lube can be forced into the drive via the "female" end with the end of a pot shaft (the cut-offs from those long Radio Shack pots that someone mentioned work well), then I gently chuck the knob end of the drive in a drill and spin it for a while to distribute the grease. Best to remove setscrews before this step, I watched one vibrate out and fall into that warp zone 1/2 inch above the floor, never to be seen again. Ace Hardware had a suitable replacement.... Apply more grease if necessary, and repeat.

Topic: 13868 Message: 13879

Nice to see the first bunch of responses. Thanks. I spent some more time poking around tonight. Unfortunately, I will be QRT for about 24 hours from troubleshooting due to interference from life's responsibilities. ;-(

To Don: Garey responded to the existence of cable drive system first: actually there are two sets of cable drives on the preselector shaft assembly, one at the front and one at the rear. Also, you must have missed my comment that I am a Wedge wannabe.. between Wedge, Barrell, and the rest of this list, I just might get this radio running!!!!! :-O

To Steve: Thanks for your comments and direction: Regarding the preselector vernier: My vernier drive is solidly pinned to the chassis. The open side faces the rear and it "looks" like it is lubed with heavy grease. Please comment on what I said in a prior message - "I hooked up a shaft extension to the rear of the preselector shaft, put a (large) knob on it and gave it some torque. No rotation. Applied enough torque to realize the shaft wasn't going to twist (rotate)." Even if the vernier was "stiff", could it possibly be "stiff" enough to resist the twist I was exerting on it? What else in this system would lock up to the point to prevent the shaft from rotating?

Regarding the RF gain pot: I have a RS close enough to get to tomorrow during my "responsibilities" run. Thanks!! J

To Jim S.: I'll give the vernier a shot of brake cleaner with everything in place as I sure don't want to disassemble the vernier or take that shaft out of there unless it there was no other choice. Thanks for the tips on the best way to grease the pig.

Interesting.

I wonder what the factory used.

The best advice I can give is one of Murphy's old maxims: if it ain't broke, don't mess with it.

I used GP grease that I still have that I originally bought for wheel bearings, but I've only had to re-lube one. I had another one that a PO had buggered-up to a fare-thee-well and had fabricated (read: kludged) a replacement bracket out of sheet metal. It didn't work and it definitely wasn't pretty.

Reminder to all: at least on the A- and B-Lines, the ball drives are different on the receiver and transmitter. You might get them to "work" by playing with shaft lengths (and kludging them) but the pointers will never fall in the right areas.

For those of you with broken drives who aren't concerned with authenticity, remember that the original R-4 was directly-driven. You can still just attach a standard pointer knob, with a short shaft to couple, and use it that way until you find a suitable part.

>If you don't see grease, you may have to take it apart and put some nice, heavy wheel-bearing grease in there.

I've heard that you don't want to use automotive wheel bearing grease on these because of some of the "stuff" that they put in it. I've used Phil Woods Bicycle Grease on Jackson drives in the past with good results. I've also used Triflow PTFE-based bicycle gease on a couple of drives out of a Swan rig.

The procedure was to remove the drives and spray/soak them with brake parts cleaner. You may need to work the mechanism a bit to break up any hardened grease - don't disassemble, you will probably regret it. The new lube can be forced into the drive via the "female" end with the end of a pot shaft (the cut-offs from those long Radio Shack pots that someone mentioned work well), then I gently chuck the knob end of the drive in a drill and spin it for a while to distribute the grease. Best to remove setscrews before this step, I

watched one vibrate out and fall into that warp zone 1/2 inch above the floor, never to be seen again. Ace Hardware had a suitable replacement.... Apply more grease if necessary, and repeat.

Ah, I misunderstood. It's my ADD kicking in...

I thought there was no rotation on the output side with rotation of the input side. If it's frozen, try Jim's idea. Put some paper towels under and around it and you should be all set. You may wind up having to remove it - be careful with the mounting shaft. You will have to un-crimp the end to get it out. They do come apart quite easily, so you should be able to clean it out.

13885. TR-7 AVC

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-23 14:47:44 UTC
From: Garey Barrell
Topic: 13885 Message: 13885

Jim and other 7 experts -

Part of my PS-7 Power Supply repair project included replacing a dead 500 Hz filter. This resulted in the TR-7 being over on the bench, away from it's R-7 buddy. I switched my 'antenna' (I use the term loosely) and was listening around the bands after the repairs.

It seemed like the AVC was too FAST for my taste on CW, in fact I was unable to tell much difference between FAST and SLOW. So I came back to the other desk and tried the TR-7 that was there. SAME!? I then switched in the R-7 and found the SLOW / CW AVC much more to my taste. Since I normally use the TR-7/R-7 as a 'pair' I hadn't really noticed it before.

Looking through the manual (!), I noticed that the t/c for the AVC is not specified, BUT that the AVC is 'further tailored' by the MODE switch. Sure enough, if I switch the TR-7 to LSB, the slower AVC that I like was there!

As I have mentioned before, my operating is almost all CW, 30 - 40 wpm, and relaxed chatting. I like the slow AVC that quiets down all the receiver noise between code elements. Back when I was chasing DX and handling traffic, I used QSK and tolerated the noise, but I don't need that instant reaction any more and so prefer my slow AVC.

All this is just for background. I haven't looked at the service manual yet to see if there is a 'non-invasive' way to change this. I know there has been quite a bit of discussion on the list about the AVC system, but honestly I haven't paid much attention to it for a while. It's not a major concern, as I use the R-7 with its more flexible AVC system anyway, just a curiosity.

Jim -

Welcome to the group!

Do you not have the manual?? Keep in mind that the 2-B is essentially an 80M receiver, with crystal controlled converters switched in front of it for the higher bands. It's important that the IF oscillators, (405 kHz and 50 kHz,) be accurately on frequency. Use the crystal calibrator if you're lucky enough to have gotten one with the receiver. If not, you may be able to connect the antenna to the antenna port of another receiver with a calibrator. If your 'other' radio is a transceiver, do not connectthe antennas together, tune the transceiver into a dummy load and connect a sampler wire to the 2-B antenna jack and hold the other end near the transceiver. Be careful to not disturb the tiny 'incremental' coils wired between the BAND switch tags on the higher bands.

First, set the Preselector pointer on 10 when it is turned fully clockwise. Once that is done, you want to align the Preselector on 40M first, and peak L2 and L4 with the dial set to the middle of the band and the Preselector set near the middle of the 40M segment onthe Preselector scale. Then switch to 80M, set the dial to 3800 kHz, peak the Preselector and then adjust C5. Wiggle the Preselector and C5 as there is a little interaction between the two.

If you don't have the manual, you might want to look at my Service Supplement CD for the 2-B. It has high resolution scans of the manual and high resolution color photos of the chassis with all parts annotated and keyed to a parts list. See infoat <www.k4oah.com>.

Again, welcome to the group, and you have a terrific radio there!! One of the best made by Drake and maybe anybody else......

$175? Ouch! I recently acquired a 2B, but I'll certainly settle for a non-matching Q-multiplier, or even roll my own before coughing up that much.

The 2-AQ and 2-BQ are both "correct" for a 2-B. I have both a 2-B and a 2-C, and zero Q multipliers, so any of the three work for me! It appears that a realistic price for a Q multiplier in pretty good (not a technical term) condition is $80-100, plus or minus a few dollars for shipping. They move every few days on the 'bay, and are USUALLY available at hamfests -- just not Dayton 2013! The price is not that much more than a 2-line speaker w/out multiplier, I guess most guys either bought a Q multiplier or used a third-party speaker, back in the day.

Good luck finding one, hope we don't bid against each other. ;-)

Interesting. For some reason I'd imagined that the 2BQ worked
on the 5okHz IF. Looking at the manual, I see that I was wrong:
it does indeed work on the 455kHz IF, so any Q-multiplier for
this IF should work.

I pick up QF-1's occasionally at swap meets, etc, with the intention of
reusing the enclosures but am then unable to bring myself to do that :)

Chuck,

I'd be curious to know what price range you had to acquire the TR-6. I have serial number 409. I paid upwards of $800 about 6 years ago. A ridiculous price but I wanted it badly to go with the rest of my Drake gear. I have toyed with the idea of selling it but haven't pulled the trigger.

I'm in no way shape or form an expert or anything close to it. Most of refurbish work will translate from all of the tr-4, TR-4c stuff posts on the various websites; cleaning, power supply rebuild, checking the screen and grid resistora, hayseed hams replacement electrolytics etc.

Stick around, Garey or one of the intelligent ones will have some additional answers for you.

Chuck -

I don't know much about the TR-6, never owned one! Near as I have been able to determine, it was built from 1968 to 1974, with probably a little under 600 units built. The highest one we're aware of is s/n 570, and shows a build date of 1974. I suspect that was a 'post-mortem' that someone 'really wanted'. Does yours happen to have the paper 'final test' tag attached? Lacking that, date codes from the crystals and/or electrolytic capacitor can give an idea of it's 'birthday'.

I have two schematics, and a copy of Milt Sullivan's original manual. Near as I can tell, the last schematic was published 12/31/70, unfortunately without a s/n suffix. I'd be interested if anyone has a later version.

Restoration recommendations would include WA8SAI or WB4HFN.

13899. TR-4C PLATE CURRENT METER

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-23 23:05:44 UTC
From: Richard Harder
Topic: 13899 Message: 13899

Does the plate current meter movement have internal dampening? I have recently gotten this rig on the air and noticed the plate current meter reminds me of a jalopy having no rear shocks or totally worn out rear shocks. The meter pointer will eventually stabilize as long as nothing is adjusted or there is no applied modulation. The pointer just swings loosy-goosy. The rig is new to me and is my first TR-4C.
Any comments are appreciated.

73'
Richard

Yes that does seem kind of high .
several years ago I was given a 2B/2CQ and about 4 months ago I saw on one of the swap/sell lists that someone had a 2C/2BQ . after exchanging pictures of them I got my 2BQ and he got the 2CQ .
good luck finding one

I have a 1011D that was doing that but it also had another problem . the metre is the edge reading one like the TR3 and I suspect the TR4 has the same type . mine was stuck on about the 20 ma mark on the scale and would not go to 0 pulled it out and noticed a small round disk stuck in the metre gap that was keeping it from going to 0 . removed the disk and since I could not find where it came from I left it out , the metre was very bouncy and would not settle down . took metre apart again and saw a bit of cement on the underside of the metre and stuck the disk back there with a bit of G/C service cement . the metre now works smoothly and is not bouncy . the disk was the magnetic damping .
the drake may have something similar .
good luck .

If its the same meter as on the TR-4, and I think it is,
its just bouncy. In fact both meters are bouncy. I doubt if
much can be done about it. Just cheap meters.

Bouncy meters
Don't know if this is the same thing .....but.

I did have a TR4 with bouncy meters a while back. Geez; how time flies.....
Wound up being static cling....no joke. Someone (on a Drake list) advised to use a sheet of clothes dryer fabric softener and wipe the outer surface. Problem went away. Carl wd8nhk

I own an L-4. The differences I am aware of is the L-4 has the ALC pot on the back of the RF deck instead of the front panel, does not have a standby switch and came with 3-400z instead of 3-500z tubes. As far as I know mine has he original finals and produces 900 watts + - with about 85 watts drive.

For longevity concerns, I rebuilt the power supply about 10 years ago. I have recently replaced the foam seal on the air compartment, oiled the fan and installed two 12VDC fans to move air through the PS. Other than thinking of adding a soft start I don't know what else I would do to it.

One could and have made it legal limit by building a new PS but 900 watts vs 1500 just doesn't seem like a big deal and may push the components closer to their tolerances.

I'm more concerned about finding out if there are any other components that should be changed out due to their age.

My TR-4 meters are bouncy and my TR-4Cw meters are much more dampened. There is a magnet on top of the movement that dampened it somewhat and also controls the zero of the needle. The coil wires loop out towards the mounting screws and I suspect that they may have some electrical dampening.

Does the S-meter act the same way as the plate current meter?

Hi Garey,

I have the PTO working well. The point of the bend in the slug shaft was right at the threads. I was able to straighten then a little. The movable metal "cam" that is driven by the leadscrew seems to have a lot of play. The cam on mine did not have threads, it was just a hole. It seems that the little plastic disk in the back of the coil is what holds the slug into alignment. The PTO seems to hold calibration well across the full 600kHz of the PTO.

Sent: Tue, May 21, 2013 6:55:38 AM
Subject: Re: [DrakeRadio] my latest TR-4

Bill -

That's typical of a TR-4 with 'used' finals. Output power of 'new' finals reaches these levels in a year or so, depending upon brand, etc. ..... However, once they get to this level they tend to last a LOT longer with reasonable care.

The relative values of those cathode resistors is more important than the absolute value. If you're tired of working on it, add some Ohmite OX ceramic composition resistors, or if you can find 'good' 2W carbon comps, and have them on hand for the next time you're in the mood!! :-) Metal or carbon 'film' resistors are not a good choice, as they don't care for current surges like these see.

Congratulations!!

I've wondered about this too... one of my TR4's (and only this one) has
this issue.
I never determined what allowed it to behave this way while others didn't

13915. 4-Line Crystals Available

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-24 12:48:45 UTC
From: Steve Wedge
Topic: 13915 Message: 13915

I've got some extra crystals available - listed by xtal frequency, then low end of operating frequency in R-4any or T-4Xany:

35.6 --> 24.5 (12m)
38.1 --> 27.0 (11m)
38.6 --> 27.5 (11m)
39.1 --> 28.0 (10m CW)
40.1 --> 29.0 (10m upper)

All are used and functioning. $20 each, shipped, or less $18 each 2 or more, shipped. Also considering a swap for one of these for a TR-4 15m rock (32.5).

Please contact me off-list...

73,

Steve Wedge, W1ES/4

Hi Bill -

Proud of you!! I'm not sure I follow the 'cam' you are referring to. The 'follower', which is the 'fork' threaded onto the lead screw, IS threaded, but it is a very loose fit. The spring from the top of the fork to the hole in the top corner of the shield can is what keeps tension on it. Drake later added a short piece of shield braidsoldered to the fork and to the side wall of the gearbox to ensure a solid ground for the lead screw/ferrite. Originally the ground was through the ball bearings and through the fork sliding along the guide bar at the top of the gearbox. This should NOT be lubricated.

Yes, the phenolic 'plug' at the rear of the slug is what keepsit stable within the coil. It should be a sliding fit, and the plug should be arranged so that it's in a diamond shape rather than a square. This minimizes the surface contact between the two pieces. Also not lubricated.

Always good to bring one back from the brink!!! Congratulations.

John -

I think this is something that needs further investigation. I have seen 'bias' magnets used to accomplish this, and I suspect that a missing or misplaced magnet is what is happening here. It also seems to me that placement of this magnet would affect the linearity and/or sensitivity of the meter as well.

The fact is that these were very inexpensive meters when new, ~$1, so are hardly precision devices. Several have been able to disassemble, switch scales, remove debris, and reassemble. No one has mentioned a bias magnet, but then I don't think anyone is looking! :-)

We know that not ALL of these meters are 'bouncy', while some are. Those old enough to remember the older still EMICO meters used on some of the early Heath and WRL gear, know what a bouncy meter _really_ looks like! Whoever manufactured the Drake meters was able to make just about all of them operatesmoothly and reliably, and I'm guessing they all came out of the factory working properly.

The 2-NT meter was originally a little bouncy, and a change was made to add a 330 uF electrolyticcapacitor across the meter terminals to damp it down.

Doug,
The S-meter acts exactly as one would expect. I'm going to pull the plate ma. meter, looking at the movement to see if something jumps out, glaringly wrong. If I can find nothing wrong, I may add a small electrolytic across the meter terminals.....although I will only do this as a last resort.....a good friend has a TR-4C, but he's been out of pocket for some time.

Doug, Thanks for your effort!
Best 73,
Richard WA4FUU

13919. Re: [DrakeRadio] What is the differences between L4 and L4B amps

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-24 16:19:28 UTC
From: GALE STEWARD
Topic: 13901 Message: 13919

Also, the L4B had a built in watt meter where the L4 had only a relative RF output indicator. The RF decks are identical. I have one of each and my main amp (the L4) puts out 1100W with the stock supply power supply on 80-15M. It's a bit less on 10M. Your tubes might be a bit soft.

Subject: Re: [DrakeRadio] What is the differences between L4 and L4B amps

I own an L-4. The differences I am aware of is the L-4 has the ALC pot on the back of the RF deck instead of the front panel, does not have a standby switch and came with 3-400z instead of 3-500z tubes. As far as I know mine has he original finals and produces 900 watts + - with about 85 watts drive.

For longevity concerns, I rebuilt the power supply about 10 years ago. I have recently replaced the foam seal on the air compartment, oiled the fan and installed two 12VDC fans to move air through the PS. Other than thinking of adding a soft start I don't know what else I would do to it.

One could and have made it legal limit by building a new PS but 900 watts vs 1500 just doesn't seem like a big deal and may push the components closer to their tolerances.

I'm more concerned about finding out if there are any other components that should be changed out due to their age.

13920. Re: R4B challenge

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-24 17:37:06 UTC
From: w7jpg
Topic: 13868 Message: 13920

Quick report on some progress:

I decided to disconnect the preselector vernier from the main preselector assembly. My objective was to eliminate one of the possible causes of the completely bound up preselector system.

Fortune smiled as the two set screws securing the preselector shaft coupler to the vernier were positioned so I could get the set screws loose. I was then able to slide the coupler far enough along on the slug rack shaft to free the vernier. I then attached my long shaft extension to the rear of the preselector shaft, put a knob on it and gave it some torque. This time, with the vernier disconnected, the shaft rotated! Yipee! All slugs appeared to be free and moved through their full range of motion. The system "felt smooth" through the back and forth rotations, maybe a bit stiff but nothing a little exercise wouldn't cure.

Today I will get my hands on that vernier, clean it up, grease it up per prior suggestions, and reinstall it for another test.

More later.

>
> After trying a couple of bands, twisting the preselector control to get some noise peak (no noise peak), I quickly realized the preselector knob was twisting but the entire preselector assembly was not moving so the slugs weren't moving. I tightened the knob and tried again. The knob rotates because the vernier (?) is allowing it to rotate but the shaft on the other side of the vernier is not moving. I hooked up a shaft extension to the rear of the preselector shaft, put a knob on it and gave it some torque. No rotation. Applied enough torque to realize the shaft wasn't going to twist. Surprising that the two dial cord assemblies could resist the torque and not slip even if a slug was frozen.
>

> Looked at the slug rack assembly and compared it to a healthy R-4B sittin them "side by side". The entire slug rack assembly of the swapmeet R4B appears to be "tilted" by a couple of degrees to the rear compared to being squared up with the chassis as the healthy R4B.

13922. L-4 Amplifier Maintenance

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-24 18:20:21 UTC
From: slowcountry1
Topic: 13871 Message: 13922

As I have completed my TR-4 and TR-4Cw projects, I am turning my attention to my beloved L-4 amplifier. About 8 years ago, I rebuilt the power supply with new capacitors, upgraded diodes and bleeder resistors. I have recently replaced the foam seal material in the bottom of the case and added fans to move air through the power supply.

Are there any other components that should be replaced or given attention? I am running, what I assume to be, the original 3-400 1968 date code tubes; full output appears at 900 watts.

As a side note, I do not have any type of soft start for the amp. I do not use the power switch on the amp, I use the 220V breaker in the panel for turning the amp on and off.

Thanks,

Doug - N9XTF

Doug -

I must have missed those. Nice photos!

I assume the large bolt under the pointer was to hold the pointer to
full scale?

I just uploaded photos of the interior of a square plate meter. I was
unable to see any sort of bias magnet, but I was unable to disassemble
it any further. My hands are just not steady enough for this kind of
work any more!

Hey, Chris -

Yeah, I've never heard of slugs getting frozen in those coils. They're pretty loose in there (relative to machined fittings...).

You probably have an issue with the input shaft to the coupler. I've never heard of one frozen up before, but there's a first time for everything. You can attach shafts to this coupler outside the radio and can watch how it's supposed to work, once you get it properly lubed.

It's fascinating, actually.

Subject: [DrakeRadio] Re: R4B challenge

Quick report on some progress:

I decided to disconnect the preselector vernier from the main preselector assembly. My objective was to eliminate one of the possible causes of the completely bound up preselector system.

Fortune smiled as the two set screws securing the preselector shaft coupler to the vernier were positioned so I could get the set screws loose. I was then able to slide the coupler far enough along on the slug rack shaft to free the vernier. I then attached my long shaft extension to the rear of the preselector shaft, put a knob on it and gave it some torque. This time, with the vernier disconnected, the shaft rotated! Yipee! All slugs appeared to be free and moved through their full range of motion. The system "felt smooth" through the back and forth rotations, maybe a bit stiff but nothing a little exercise wouldn't cure.

Today I will get my hands on that vernier, clean it up, grease it up per prior suggestions, and reinstall it for another test.

More later.

> I proceeded to see if the receiver would cooperate and hear some signals.
>
> After trying a couple of bands, twisting the preselector control to get some noise peak (no noise peak), I quickly realized the preselector knob was twisting but the entire preselector assembly was not moving so the slugs weren't moving. I tightened the knob and tried again. The knob rotates because the vernier (?) is allowing it to rotate but the shaft on the other side of the vernier is not moving. I hooked up a shaft extension to the rear of the preselector shaft, put a knob on it and gave it some torque. No rotation. Applied enough torque to realize the shaft wasn't going to twist. Surprising that the two dial cord assemblies could resist the torque and not slip even if a slug was frozen.
>
> Looked at the slug rack assembly and compared it to a healthy R-4B sittin them "side by side". The entire slug rack assembly of the swapmeet R4B appears to be "tilted" by a couple of degrees to the rear compared to being squared up with the chassis as the healthy R4B.
>
> Each of the slug adjustment screws for T-1 through T-4 on the swapmeet R4B is corroded (rusted) at the point where they pass through the adjustment nut. A couple of the adj. screws are slightly bent above the nut. (appears to be a common affliction as one is slightly bent on the healthy R4B.

Yeah, I'm an upstart. Groucho slapped his opponent after being called this.

I know there are a lot of people who have been to Dayton and have bought gear there in the heat of passion. If you bought Drake gear there that needs some work, I can help.

I know there are a lot of guys and gals out there who work on Drake gear and I want to put my name into the list of possible folks who work on this gear. I truly love these radios and have a connection dating back to 1983, when I owned my first R-4A that I used as my receiver in conjunction with my Swan 500. I am very familiar with the Twins and know how Drake built their gear. I would be honored if you'd consider me to help you bring your Drake gear up to spec or if you asked me to bring it to life from a dead radio.

I am of the "wash it" school. Tube gear can be washed with plain ol' detergent and water! I used distilled water for the final rinse and I have never lost a radio to this method: in fact, Tektronix used this method for decades - which is where I learned it. You'd be amazed at how good your rig will look after a good, thorough washing! I do not immerse nor use a dishwasher.

Please email me if you're interested. I'm trying to establish myself and as I get more work, I can get more services (like painting) lined-up.

Garey,

It took me a minute to figure out what you were asking; good grief I must be getting tired.

The brass screw, just under the meter movement is one of two screws that goes vertically through the meter to hold the top clear plastic cover on the bottom clear plastic body. It just happened to fall into bottom of the meter prior to the picture; it was not placed there on purpose. Luckily they use screws so that one can easily open them up. The problem is that if you don't expect the fine enamel wire to loop out towards the screws holding the green coil board down, they break very easily.

I was never able to determine why this meter movement started acting like it was on a spring. The magnet worked just fine and the wiring appeared just like the one I replaced it with. I replaced it with another and it was dampened again. I have absolutely no idea; I tried a little bit of mechanical dampening but that made the meter too stiff. Therefore, it sits in my junk box in the event I need to scavenge some parts from it.

Regards,

Doug N9XTF

Doug -

I must have missed those. Nice photos!

I assume the large bolt under the pointer was to hold the pointer to
full scale?

I just uploaded photos of the interior of a square plate meter. I was
unable to see any sort of bias magnet, but I was unable to disassemble
it any further. My hands are just not steady enough for this kind of
work any more!

Jim:

Does your RV-6 have a serial # on the rear plate of the chassis? Mine does not – wonder if it's somewhere else on the chassis? Maybe have to pull from the cabinet to see.

Anyone know how many RV-6's were made? Have heard 60 or so but hard to believe it's that low.

How about TC-2's and TC-6's? Think the highest serial # I've seen on those is just on the high side of 300. Highest TC-2 on Ron's site is below 300 – no TC-6's listed.

My TR-6 is an early one at #086. Works fine and is loaded – had to replace a broken "bandswitch" wafer in it once though – not a fun job.

I've got TR-6 #455, originally owned by a ham in Council Bluffs, IA. Also have the RV-6, original manual, and the last of the optional filters that Drake had when they were selling out the last of the parts stock. I haven't had it on the air in quite a while, due to lack of space in the current shack configuration.

Stew,

What plate voltage is indicated on your L-4 no load? I have not seen a reference to what it should be. My meter indicates almost 3KV. I do not have access to a high voltage probe anymore; I would love to know if this is accurate. I ran a dedicated 220VAC line to my shack and if memory serves, its about 235 or 240VAC. If the taps are supposed to be 220VAC, the line increase would explain a little elevation on the plate voltage.

Do you follow the tuning procedure in the manual to .585 IP and 220 IG? It seems as if Drake instructed the operator to tune so those values were present on CW/TUNE as an absolute requirement. I tune for maximum power which in turn results in lowest IG. It seems that I've read several places that one should run the lowest IG. I advance the loading cap a little past maximum output power to load a little more heavily. On a whistle in SSB setting I derive somewhere just under 700ma IP and 160 IG. If the plate voltage were correct this would yield like (2900*.700)*.65 = 1395 watts output. Therefore, either my plate voltage is not what is indicated or my W4 and MN-2000 are out of calibration. I try to run the set around 600 -700 watts when I use the amp.

Your thoughts?

Regards,

Doug N9XTF

Peter -

I've never had an RV-6, but the RV-4/Cs that I have seen have had the s/n stamped just to the right of the grounding bolt on the rear lip of the chassis.

I don't have any official numbers, but I wouldn't be surprised if there were that few RV-6s made. Not a lot of call for 'split' operation on 6M.

My TC-6 is s/n 0132, and the TC-2 is s/n 0328. My guess would be <250 and <500 respectively. My CC-1 is s/n 502.

Doug -

Absent a HV meter (Triplett 630-NA or similar), your best bet is accurate ohmmeter readings ofthe 1 Meg resistors and the 100k of the meter voltage divider and then calculate the voltage.

The 0.585 A and 220 mA were specified as that was the power limitat the time, i.e., 1000 Watts INPUT. 1750 VDC x 0.585 mA = 1023 W INPUT. There is a graph in the manual of EP vs IP for 1000W INPUT. This limit was set before most hams had reasonably accurate Wattmeters. By the time the next limits were set by theFCC, most DID have wattmeters and so the limit was set to 1500 W CW or PEP, OUTPUT.

The line voltage is specified at 230 VAC, or twice the nominal 115 VAC +/- 10V.

Plate V is about 2700 no load and about 2400 under load (key down). Power out in this condition is about 1150W on 40M.

Don't worry too much about actual numbers. I just tune mine for maximum output. I normally drive it with a TS-850S (100W).

Working the WPX contest right now on 40M with it.

> I own an L-4. The differences I am aware of is the L-4 has the ALC pot on the back of the RF deck instead of the front panel, does not have a standby switch and came with 3-400z instead of 3-500z tubes. As far as I know mine has he original finals and produces 900 watts + - with about 85 watts drive.
>
> For longevity concerns, I rebuilt the power supply about 10 years ago. I have recently replaced the foam seal on the air compartment, oiled the fan and installed two 12VDC fans to move air through the PS. Other than thinking of adding a soft start I don't know what else I would do to it.

From: VE3AX/7
Topic: 4985 Message: 13933

Garey/Al;

Aha! Thanks guys. Found it! Serial #0132, so guess there were more than 60 RV-6's made. I was looking for a serial # font typical of that used on the 4-line but this is half-sized or less, but is the same font as used on at least one of my RV-4's. Just happened that the insulated terminal on the ground wire was covering it up.

Garey – given your history in the ham radio sales & marketing world, any idea what the 3rd expansion slot in the CC-1 was meant for? 220 Mhz? 432 Mhz? Homebrew converter? My CC-1 has a commercially made (non-Drake) aftermarket noise blanker that is operated from the front panel switches for that 3rd converter. Maybe Bill Frost could answer that one?

One other question while we are on the subject of the Drake VHF stuff...has anyone ever tried a 5894 in place of the 8643 in the TC-2? They are pretty close in specs with the 8643 maybe being a little more dissipation/output, but they are a LOT harder to find, I have no spares, and do have near a drawer full of brand new 5894's. Maybe only one way to find out! No need to yet...but would be good to know.

Peter -

I've never had an RV-6, but the RV-4/Cs that I have seen have had the
s/n stamped just to the right of the grounding bolt on the rear lip of
the chassis.

I don't have any official numbers, but I wouldn't be surprised if
there were that few RV-6s made. Not a lot of call for 'split'
operation on 6M.

My TC-6 is s/n 0132, and the TC-2 is s/n 0328. My guess would be
<250 and <500 respectively. My CC-1 is s/n 502.

13934. TR-4 bouncing meters

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-25 07:04:36 UTC
From: Richard Knoppow
Topic: 13934 Message: 13934

I got curious so I opened up my TR-4 and tested the meters to see if a dead short across them would damp them. It did not. I am puzzled by this. A meter is a motor and like any motor generates a back EMF. Normally, if you short the terminals of a meter the pointer moves only very sluggishly. In fact, its standard practice to short the terminals when shipping meters. All I can think is that these are not very sensitive meters. I did not want to disconnect them to measure the DC resistance but that would be a clue.
Its possible to damp a meter by means of an eddy current turn, these meters do not appear to have one.
BTW, I discovered the Receive/Transceive switch on the side is broken. I will have to track down a replacement.

Richard,

Shouldn't be too hard to find a slide switch. If you have trouble, let me know. There is a surplus store here that usually has a large inventory of slide switches.

OK. I suspect that was a VERY late RV-6, I still don't see much demand for split operation on 6M!! Not like you have to deal with pileups that often. :-)

I don't know of any option from Drake ever being made available for that third slot. As I recall the advertisement said something like 'a third slot for another band of your choosing'. Interesting to find a Noise Blanker in there. What was it? Where was it applied? Separate antenna like Collins used?

Bill may have other info on that third slot, but I have found his 'hard drive' full to overflowing just keeping up with what they DID do!! :-) Just as an example, he had no recollection of the color coded crystals for the Late A and B Lines!! I keep forgetting that in spite of his outstanding cooperation and patience with goofballs like me(who even CARES about color coded crystals 50 years later), this was his daily JOB. I remember quite a bit of what I did at NASA and NRAO, but there's a LOT I doNOT remember at all!! :-)

Dunno about the 5894. It's slightly taller, and considerable lower interelectrode capacitances (it's rated to 500 MHz v 175 for the 8643) but looks like it 'should' work. Apparently the 8643 was a Motorola special tube designed for mobile use, and was only used in one model! How Drake ever found it is amazing. I bought one spare for $40 about 10 years ago from a tube dealer at the Shelby hamfest. It was in a Motorola box and he said that was all he'd ever seen. There's probably a hundred of them in all that mobile FM commercial trash that shows up at every hamfest, if we only knew which one!! :-) I guess I would just keep my eyes open for a spare, and if yours should fail, try a 5894. I'd bet it will either work or could be MADE to work without much effort.

13940. Re: [DrakeRadio] TR-4 bouncing meters

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-25 14:39:54 UTC
From: Garey Barrell
Topic: 13934 Message: 13940

Richard -

The square 4-Line meters are all ~3 mA fs and 440 ohms. I say 'about' 3 mA as I have found them anywhere from 2.9 to 3.1 mA, with most on the low side.

I just checked the one I disassembled yesterday, (yes, it still works! :-) ,) and a short across the terminals definitelydamps the oscillations caused by rapid wrist movement. Itbounces from 1/3 to 1/2 full scale 'open', and at most about 5% when shorted. So Maxwell was correct!!

Comparing the photos, both appear to be moving magnet style meters of similar design. The small plate that appears to be the rear pivot point in interesting in that it is fastened by a couple of rivets, indicating some sort of production adjustment. I wonder if instead of a pivot point it is actually magnetic and used to either zero or perhaps damp the movement, or both, by it's placement. While disassembling this one, I noticed that bringing a steel screwdriver (NOT magnetized) near the movement could affect the position of the pointer by a considerable amount.

A shorted turn in the coil would definitely damp any magnetic field, (perhaps what you are calling an 'eddy turn'?)

13941. R-4B PBT issue resolved - Garey scores again!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-25 17:09:16 UTC
From: Steve Wedge
Topic: 13941 Message: 13941

Yes, it was C126. The S-meter is now also much more sensitive than it was, too.

I already ordered some 0.1 uf metal film caps from Digi-Key, but I should have checked out Radio Shack first: they actually stock a 0.1 uf, 250V metal film capacitor!

I'll have spares, anyway.

It's sitting in place of my station R-4B and now I have a tough decision to make.

From: Steve Wedge
Topic: 13942 Message: 13942

I'm burning in my "new" R-4B at the station receiver position. I now have to sell one of them.

I'm pretty sure I'll be keeping this one I just did and selling my station receiver. The station receiver has all NOS tubes except for the 6HS6's and 6EH5 - which were tested fine. Has the full Hayseed Hamfest recap (all electrolytics have been changed). 8.5/10 cosmetically with the front panel and cabinet. though the silkscreen's gone from the lower cabinet. Chassis was stripped and cleaned two years ago and a large corrosion spot near the PTO was touched up with copper paint. PTO and all other lubrication spots have been addressed. The rest of the chassis is nice.

I'll be putting it up for auction if no-one here's interested first.

13943. Are There Any Demonstration Videos of Sherwood Upgrades?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-25 17:27:30 UTC
From: marrer_enterprises
Topic: 13943 Message: 13943

I've looked around and cannot find much of anything anywhere.

Are there any videos online that show a stock R-4C side by side with another receiver containing each of the various Sherwood mods so that a person can get a better idea of the improvements that are available? It would be nice if a person could see - and hear - for themselves to determine which are really needed based on the way they use their receivers.

For example, they offer many versions of SSB roofing filters, but what exactly does each offer in the way of cleaning up the signals? Tech specs are nice, but would be even better to hear a demonstration in a real world situation.

13944. Re: [DrakeRadio] Are There Any Demonstration Videos of Sherwood Upgrades?

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: Garey Barrell
Topic: 13943 Message: 13944

I don't know of any. Would be a good project for a Sherwood fan.

The idea of the 'roofing' filter is to get the most filtering as close to the antenna as possible. The 600 Hzroofing filter is obviously for CW or data modes. It greatly restricts the Passband Tuner range, and effectively kills the Noise Blanker. But for receiving CW in impossible conditions it's hard to beat with anything on the market. Of course unless provisions are made for switching it out, leaving the 8 kHz 'stock' filter,or relay selection of the 2.2 kHz(?) SSB filter, it makes the 'C' a CW only receiver. Even with the SSB filter the Passband Tuner is still pretty irrelevant. The filter width is purely a tradeoff of fidelity vs readability. You can read SSB with a 500 Hz filter by manipulation the Passband Tuner to pick out the midrange tones that carry 80% or more of the intelligibility, but it doesn't sound very good. On the other hand, a 4-6 kHz filter gives great fidelity even on an SSB signal, _unless_ there is another station 3 kHz away!

The 3rd IF/Product Detector mod eliminates the noisy 6EJ7 and provides a much cleaner (lower distortion) PD, using I think the MC1496? which is what is used in the R-7 and later TR-7s. The AF output is much more efficient than the Class A original, greatly reducing the load on the power supply.

The Power Supply is also more efficient, using 3 terminal regulator ICs. Combined with the reduced AF PA stages the overall heat in the receiver is reduced.

There may be more, but that's all I can think of. My opinion is if you need the best CW receiver for contest or DX operation, especially on the low bands, you probably cannot buy a better receiver. The SSB function is also improved under those conditions, just becausethe filtering is that much closer to the antenna. In either event you give up the NB and most of the Passband Tuner functionality.

For day to day hamming on today's uncrowded bands, I still prefer the B-Line! :-)

What I have not been able to figure out is what causes a good meter to act normal and then change to a real bouncy one. I have compared bouncy meters that I replaced on my TR-4Cw to good ones and cannot find a mechanical or electrical difference. I even tried the static removal route for shiggles without results.

13946. Re: Are There Any Demonstration Videos of Sherwood Upgrades?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-25 20:01:26 UTC
From: marrer_enterprises
Topic: 13943 Message: 13946

Thanks for the reply. I bought a R-4C that already had the Audio Amplifier, Power Supply and Capacitor mods installed. I sent it to Sherwood to be aligned and to check out the installed mods - don't know if the previous owner(s) did the install themselves or had Sherwood do it.

I figured that as long as it was out there, I'd have them install the 3rd Mixer and Product Detector mods too.

With my planned use of the rig - not a big DXer or contester - I didn't think any of the roofing filters would be necessary. But, some sort of demonstration would have helped assure me that I was making the right decision.

Topic: 4985 Message: 13947

Garey:

BTW, my TC-2 is #236, TC-6 is #116, and CC-1 is # 499.

The noise blanker, model TNB for “transistorized noise blanker”, was made by Westcom Engineering Co. in San Diego around the 1970 time frame. Basically, it was a very high gain IF amp with diode clipping, so adjacent strong signals can be a problem with it. It was available with a choice of IF’s at 40m, 20m or 10m, shipped for $29.95, and there was a separate model for the Swan 250 at $32.95. You could even specify connector type and voltage.

You can read a review in this 1970 “Cheese Bits” put out by the Pack Rats VHF Club.

http://www.packratvhf.com/Cheese%20Bits/Cbits1970_05.pdf

Boy, there are some calls in that article that bring back memories!

In the CC-1, the TNB is mounted so that its slide switch to put it into the IF line to the receiver lines up with the “ON-OFF” push-pull rod meant for that 3rd converter.

Peter -

OK. I suspect that was a VERY late RV-6, I still don't see much demand for split operation on 6M!! Not like you have to deal with pileups that often. :-)

I don't know of any option from Drake ever being made available for that third slot. As I recall the advertisement said something like 'a third slot for another band of your choosing'. Interesting to find a Noise Blanker in there. What was it? Where was it applied? Separate antenna like Collins used?

Bill may have other info on that third slot, but I have found his 'hard drive' full to overflowing just keeping up with what they DID do!! :-) Just as an example, he had no recollection of the color coded crystals for the Late A and B Lines!! I keep forgetting that in spite of his outstanding cooperation and patience with goofballs like me(who even CARES about color coded crystals 50 years later), this was his daily JOB. I remember quite a bit of what I did at NASA and NRAO,

but there's a LOT I doNOT remember at all!! :-)

Dunno about the 5894. It's slightly taller, and considerable lower interelectrode capacitances (it's rated to 500 MHz v 175 for the 8643) but looks like it 'should' work. Apparently the 8643 was a Motorola special tube designed for mobile use, and was only used in one model! How Drake ever found it is amazing. I bought one spare for $40 about 10 years ago from a tube dealer at the Shelby hamfest. It was in a Motorola box and he said that was all he'd ever seen. There's probably a hundred of them in all that mobile FM commercial trash that shows up at every hamfest, if we only knew which one!! :-) I guess I would just keep my eyes open for a spare, and if yours should fail, try a 5894. I'd bet it will either work or could be MADE to work without much effort.

Doug -

I guess I don't know all Iunderstand about meters..... :-)

There doesn't appear to be any adjustment, aside perhaps from the flat plateunder the movement that was riveted in place after some
adjustment. At first I thought it was the lower meter pivot, put I don't think that's the case. I guessthe two rivets are already there,
and the end of the small plate under the meter movement has a clearance hole. At final test the plate is shifted to whatever end, and then
the rivets are crunched down. Looks like a fairly limited range of movement is available. I'm reluctant to disassemble this meter any
further, since it IS a good one. Perhaps if someone has a bad (bouncy) one to experiment on. Probably going to take someone steadier than
me if thereis to be any hope for successfully reassembling it!!

The other thing that occurred to me a few minutes ago is that these meters are shunted by a fairly low resistance in circuit. The TR-4 meter
is shunted by ~2 ohms, which is essentially a dead short to a 440 ohm movement winding. Even the ones in the Twins have only a hundred or so
ohms across them.

I just don't understand what makes one 'change' after some period of time.

Peter -

OK, I'll add yours to MY list! Ron used to include units that no longer had the final inspection tag, with an estimate based on crystal or
electrolytic date codes or purchase dates, but made the decision some time ago to accept ONLY those with the official tag date.

I keep my own little list starting with his list of some years ago and then adding s/n as found even on eBay, etc. just to see what the
range of s/ns might be.

Interesting product. I must have missed that one completely. Yes, diode clipping can cause as much or more trouble as it solves if
overdriven. I will say it's the only thing I've ever seen or heard of being used in that slot..... :-)

I just read the review. Sounds like a valid concept, getting the diode clipper in front of the IF and IF filter. You could put a Drake
type 'blanker' in line in the same way, i.e., sample the spike, invert and amplify it and apply to a later stage within the filter. I'm
surprised someone hasn't come up with that by now. I guess there are so many standalone VHF rigs that nobody uses converters anymore.

I don't think a static charge would cause bouncing.
Its more likely to cause the pointer to stick or to move in
jerks. It could also account for a meter reading up-scale
when turned off. Both of those symptoms can also be caused
by dirt in the coil or something between the pointer and
scale. Sometimes if its a static charge the pointer will
move around if you drag your finger across the window. The
bounce is something else. One would think there would be
some measurable difference between two meters of the same
type where one bounced and the other didn't. If its a
magnet problem it should affect the sensitivity. It might
be interesting to dig out those two meters and see how they
work as generators. Hook each to a scope and jiggle them to
move the pointer, see if there is any difference in the
voltage at the terminals. The meters in my TR-4, which are
very bouncy, did not change when I put a clip lead across
the terminals (with the rig off of course). They still
bounced about as much as before when moved around. I
suppose its possible for something to have changed
mechanically but that should show up as either a change in
sensitivity or in generated voltage. Somewhere there is
someone who is a genuine expert in these things who would
know.

Hi,

FYI:
Here are the serial numbers of my TR-6's and more:

TR-6 # 016
TR-6 # 493
(A third TR-6 is on the way. I don't know the serial # yet)
RV-6 # 011
TC-6 # 0194
SC-6 # 001 !!!!! (I have another too that I have not yet checked)

TC-2 # 0035
TC-2 # 0052
TC-2 # 0325

CC-1 # 002 !!!!
CC-1 # 545
CC-1 # 585

I have not checked my SC-2's.

73,
Sindre, LA6OP

Keeping the filaments at the correct voltage is very important to get maximum life from tubes.

Seems I recall Eimac (and others) want +-5% on that. Both too much and too little are bad.

What with elevated line voltage these days, 220 VAC has become 240. So it behooves to check fil. voltage at the tube socket both with & without amp. load.

Hi fellas, Richard Harder WA4FUU who originally posed the 'Bouncing Meters' query is a good friend of mine and lives only a few miles away. He emailed me about my TR-4C's meter but before I could reply he'd already left to go see his daughter and her family. I don't know if Richard has been able to read all the great comments but I know if he hasen't he'll be very pleased when he gets home. On further note, Richard is the one who found the problem in my -4C ie, being intermittent/erratic in both transmit and receive. I had chased that gremlin for months to be in fact. Gave up and asked for his help. Richard found a loose tube socket which with the least physical movement or thermal induced metal expansion or contraction (breaking ground path) would send that rig into hysterics. Sorta a serendipitous find that I should have found, but Richard was the one who thought outside of the box, being the better tech than I. Soooo.....wiggle and jiggle cause loose parts can really tax your smarts.

It tis great to be with great group 'of ya own kind' with all the team work that occurs in earnest. Guys, this is good.

Stick to the audio mods and anything with the 3rd mixer for late-production R-4C's. That 3rd mixer was a real noise generator. There's a mod by Sartori that's simple to implement with only a choke and some other passive components and some slight re-wiring of the 3rd mixer. It is definitely worth doing. You can also substantially cut down on the frying pan noise by judiciously selecting a 6EJ7 that is quiet.

Subject: [DrakeRadio] Re: Are There Any Demonstration Videos of Sherwood Upgrades?

Thanks for the reply. I bought a R-4C that already had the Audio Amplifier, Power Supply and Capacitor mods installed. I sent it to Sherwood to be aligned and to check out the installed mods - don't know if the previous owner(s) did the install themselves or had Sherwood do it.

I figured that as long as it was out there, I'd have them install the 3rd Mixer and Product Detector mods too.

With my planned use of the rig - not a big DXer or contester - I didn't think any of the roofing filters would be necessary. But, some sort of demonstration would have helped assure me that I was making the right decision.

Just to "recap" (sorry!).

The problem I had with my R-4B was due to a bad capacitor C126. This cap sits in the plate circuit of V4, right at the input of the PBT circuit. It was apparently open, as removing it from the circuit did not change the symptoms.

Symptoms were a lack of responsiveness of the S-meter, severe attenuation (2-3 S-units) of the signal at the 400 Hz setting and an inability to peak the top-left coil in the slug rack when doing the PBT alignment. The other 3 coils peaked as they should.

This capacitor is a metal-film part and is located near the power supply, on a small board (Garey's CD calls it out as Board 7). Mine was a black plastic part but I've seen pics of the yellow cylinders as well. New parts are shaped more like silver mica parts and are much smaller. Replacements for this cap are available at Radio Shack.

Subject: [DrakeRadio] R-4B PBT issue resolved - Garey scores again!

Yes, it was C126. The S-meter is now also much more sensitive than it was, too.

I already ordered some 0.1 uf metal film caps from Digi-Key, but I should have checked out Radio Shack first: they actually stock a 0.1 uf, 250V metal film capacitor!

I'll have spares, anyway.

It's sitting in place of my station R-4B and now I have a tough decision to make.

If you have means to test this cap it would be
interesting to know what happened to it. Its a bypass cap
on a B+ line that feeds the plates of the in put and output
amps of the tunable IF plus the line goes to a couple of the
IF screens. I think the S-meter reads the difference in
current between the screens and plates. If its leaky it
could pull the voltage down, if open of has a high ESR it
could allow feedback through the line. I am not sure I
would have spotted this on my own.

I'm guessing it's open. Those are very high reliability, film/epoxy caps and wouldn't show an increase in ESR due to evaporation like
electrolytics do. As you say, it's part of the S-Meter bridge circuit, which was my second clue. First clue was the inability to tune L1 in
the PB tuner. If C126 is open, there is no AC return for the L1/C1 resonance pair, which would make it difficult to tune! :-) Granted the
DurMica 'could' fail, as could the 0.015 uF C2, but both are a lot less accessible than C126!! :-) Occam's Razor strikes again.......

I wasn't seeing the forest for the trees, either, Richard. Garey suggested checking C126 and it made perfect sense. I was focused in on the circuit of the PBT itself or my brain was seeing that cap and equating it with the 1030 pf cap in the filter itself (it's nearby and would also affect L1's tuning if it was go go bad).

I'm listening to the R-4B right now, on 17m and it sounds great. I do believe that this receiver's S-meter (which came from my parts T-4XB and got the scale transplanted) is slightly "bouncy" like some of the TR-4's that have been described over the past week or so. It bounces even with the AVC set to "slow". It doesn't bother me, though.

If you have means to test this cap it would be
interesting to know what happened to it. Its a bypass cap
on a B+ line that feeds the plates of the in put and output
amps of the tunable IF plus the line goes to a couple of the
IF screens. I think the S-meter reads the difference in
current between the screens and plates. If its leaky it
could pull the voltage down, if open of has a high ESR it
could allow feedback through the line. I am not sure I
would have spotted this on my own.

It was very easy to get at C126

If any of you have this part fail, I've now got spares and can pop one in the mail.

I'm guessing it's open. Those are very high reliability, film/epoxy caps and wouldn't show an increase in ESR due to evaporation like
electrolytics do. As you say, it's part of the S-Meter bridge circuit, which was my second clue. First clue was the inability to tune L1 in
the PB tuner. If C126 is open, there is no AC return for the L1/C1 resonance pair, which would make it difficult to tune! :-) Granted the
DurMica 'could' fail, as could the 0.015 uF C2, but both are a lot less accessible than C126!! :-) Occam's Razor strikes again.....

13970. I've got a candidate for a photo story.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-26 23:43:14 UTC
From: Steve Wedge
Topic: 13970 Message: 13970

That T-4X that my son chased all over Asheville arrived on my doorstep last week. Cosmetically, it's about a 7/10. The PTO shaft has an enormous amount of play and the meter doesn't appear to be working or there's absolutely no idle current. The PTO and premixer are working. There's very little detent in the band switch. I see the ball bearing is there, so anyone got any suggestions on bringing back some positive detent?

This should be a good candidate for me to document with photos as I bring it back to life.

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

Try cleaning the switch and lubricating the detent
first. I don't remember exactly how this switch is
constructed but most have a sort of scalloped surface the
ball runs in and a spring to load the ball. If the spring is
weak the detent action will be weak.
The PTO is the same problem I asked about several days
ago, there is an Allen head screw that adjusts the loading
on the single ball that holds the back end of the shaft. If
there is really a lot of play the ball may have fallen out.
Its probably a standard size ball so if its missing one can
be had from many hardware stores. Garey or someone probably
knows the size.
Lack of indication on the meter might be a bad meter,
bad resistors in the measuring circuit, bad tubes (really no
current). You should be able to isolate this with a plain
VOM. I would start with the meter with the set turned off.
If it deflects with the ohm meter put across it its OK. You
can check the tubes for current by measuring the drop across

the cathode resistors. Of course check the power supply. I
am assuming this TX is similar to the T4XB.

13973. Interesting T4xC Problem Solved

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-27 04:06:15 UTC
From: GALE STEWARD
Topic: 13973 Message: 13973

Since my B-line has been operational, I started on refurbing the C-line, starting with the T4XC & AC-4. I installed another of Paul's upgrade kits in the AC-4. Cleaned up the T4XC and looked everything over.

When I fired up the T4XC on the bench (separate, no rcvr), thru my Bird 43 and my 200W, 30db attenuator with an additional 20db pad on the end of it that I use as a load. The xmtr show output on 7, 14, & 21 bands but the RF tune peaked in the wrong places (not in the band). I hooked up the freq. counter and found the frequencies to be way off. EX: the 7 mhz peak was at 5.6 mhz. There is an accessory xtal installed for 28.0 mhz in position 1 and when switching to that position with the XTALS switch, everything worked normally. The RF Tune peaked at the correct spot and the counter read correctly. I found that the wafer of the Band Switch that switches the band xtals showed an open, the common terminal (wiper). It all looked good but showed open. I applied Deoxit with a Q-tip and everything started to work normally. I've found intermittent connections before but never a "full open", especially when the switch looks all OK. It was reading in the megohms!

Anyway, apparently the T4XC is OK and I'll start on the two R4Cs.

Steve -

Unfortunately some feel that the BAND switch is too hard to turn and think they'll fix it by prying up on the flat spring steel 'donut' on
the detent at the back end. Once 'sprung', not much that can be done with it. It CANbe replaced with a donor detent/shaft.

PA tubes can fail to ZERO idle current, often as a result of losing Plate voltage. The Screen tries to BE the Plate, and 'poof'. Obviously
RFC2, R38 or Meter switch are all suspects. You can check the meter with a DMM, should be ~ 3 mA fs, and ~440 ohms. Do NOT check with a
VOM, too much current on the low ohms scales.

Looking foward to your 'photo essay'!

C126 went bad in my early 13-tube R-4A years ago.
It was purely mechanical, one of the leads lost contact with the cap
itself. In my case, the receiver worked fine after it was well warmed
up but during warm up, the gain of the the whole receiver would go up
and down with a "click". Muting via the ON or PTT would cause a
transient that would get connection for a few more seconds/minutes.
Darn thing bugged me for years! A Radio Shack replacement worked fine.

Topic: 13941 Message: 13978

Gary -

Good reference point. I think that may be what is wrong with Steve's unit as well. Just an'open' cap. Possibly a weak point in the design
of the capacitor, or someone got too aggressive with the pliers at installation. Maybe cut the lead a tiny bit short and 'stretched' it to
reach! :-)

Over the years I have found those capacitors to be excellent quality, and I can't remember a failure from 'leakage' or shorting.

Oh, yes - I've adjusted my share of them and have had the bearings fall out before. I have started using moly grease for these - the same stuff that's used for CV joints - after cleaning out all the old grease.

Steve -

Sounds like fun!!! :-)

Balls are all 1/8" steel, Ace or True Value, usually in the little yellow boxes back in the fastener section.

Should be 10 in front, and one at the back. Allen wrench is 3/32".

C126 went bad in my early 13-tube R-4A years ago.
It was purely mechanical, one of the leads lost contact with the cap
itself. In my case, the receiver worked fine after it was well warmed
up but during warm up, the gain of the the whole receiver would go up
and down with a "click". Muting via the ON or PTT would cause a
transient that would get connection for a few more seconds/minutes.
Darn thing bugged me for years! A Radio Shack replacement worked fine.

13981. Restoring vacuum tube equipment after long storage.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-27 16:28:36 UTC
From: w2dsb
Topic: 13981 Message: 13981

I have been reading the mail for some time. Tried searching this topic, but no luck. I have a general idea what to do. Just looking for some pointers. I have been told to connect the device to a variac and bring the voltage up slow. I do not know what effect this would have on the tube filaments? Also how helpful is an ESR meter? Thanks in advance.

73, Bob

Hi, Bob -

You can bring it up slowly - the jury is out on how slowly you need to go. I recommend a Variac with a current meter so that you can shut down if the current is excessive. I usually bring old unused equipment up over the space of about an hour. Some folks feel a few days are needed.

Most of these Drake rigs are still working fine with their original electrolytic caps installed, but it you hear any sort of hum on the signal, it's time to change them. My own station equipment has been re-capped. It's cheap insurance against an old cap shorting out and taking the power transformer with it. I had that happen once with a Hallicrafters SX-70 and it filled my shack with smoke while I was upstairs having supper. Naturally, the receiver became junk after that. Darn thing almost caught on fire!

Bob -

I venture to say you'll get about four more answers than you get responses!!

The 'Start at 0 and raise theprimary voltage five volts every 12 hours' idea is, to meat least, ludicrous.

My process is as follows.

Careful inspection, inside and out, for any obvious problems. Spiders, dead mice, old nests, broken or missing tubes, wire ends hanging in
space, etc. Go through with screwdriver and put it on every mounting and grounding screw to test for tightness. Replace any broken ones. Be
SURE the _correct_ fuse is in the holder!

I have an ESR meter, a good 'Blue' from Australia, but the Chinese digital knock-offs for $10 on eBay probably work. It's not a precise
test, more of a 'GO-NO-GO', as very few electrolytics test 'marginal'. They're either fine, or they're dead. A quick, in-circuit test
validates or condemns all the electrolytics pretty quickly.

Then bring out the 'light bulb' test box. This is just a box with a regular light bulb, (chosen to approximate the power requirements of the
radio,) wired in series with the AC line, and a switch to bypassit. Plug it in and plug the new radio into it, and turn it on. The bulb
should flash brightly for a few seconds, and then dim out as the initial inrush current to the filter caps and filaments charge/heat up. IF
however the bulb STAYS bright, or dims only slightly, you have either a power supply or power transformer problem. Voltage measurements of
those areas with the bulb still in circuit will usually allow you to find the short. You'll read greatly reduced voltages, down to zero
volts on the shorted component, or NO voltages at all, indicating either a shorted power transformer or fuseholder, or line bypass cap, or
power cord, or... If the bulb does dim down, I usually let it run for 30 minutes or so with the bulb in circuit, staying in the general
area. Then flip the switch and the radio will most likely operate fine, or at least well enough for you to troubleshoot minor problems such
as bad tubes, open or shorted bypass caps, etc...

If its open an ohm meter will tell you. Except for very
low value caps you can see the cap charge up on the meter.
If you are not sure then reverse the leads and see if it
kicks.

I second that motion! And I might add, an ohmmeter check first for any obvious shorts or leakage is a great place to start!
The variac with a current meter and it is most a matter of SWAG, gut feel, and intuition as to how fast is too fast. I start at about 50vac and sometimes take days to get to 120vac. Sometimes an hour or two. Depends on the age of the piece, power rating and how the current behaves. Linear amps I do the tube filament cook seperate from the hv section. Burn in the tubes real good (days) before adding the plate voltage which was done seperately with the tubes removed.
An awfully lot of the capacitors I routinely replace test as good or better on the esr meter than the new variety but as Steve says---cheap insurance.
And, of course, if it involves an AC-3, AC-4 or L-4PS I'd like to help you with that with a nice rebuild kit

Try cleaning the switch and lubricating the detent
first. I don't remember exactly how this switch is
constructed but most have a sort of scalloped surface the
ball runs in and a spring to load the ball. If the spring is
weak the detent action will be weak.
The PTO is the same problem I asked about several days
ago, there is an Allen head screw that adjusts the loading
on the single ball that holds the back end of the shaft. If
there is really a lot of play the ball may have fallen out.
Its probably a standard size ball so if its missing one can
be had from many hardware stores. Garey or someone probably
knows the size.
Lack of indication on the meter might be a bad meter,
bad resistors in the measuring circuit, bad tubes (really no
current). You should be able to isolate this with a plain
VOM. I would start with the meter with the set turned off.
If it deflects with the ohm meter put across it its OK. You
can check the tubes for current by measuring the drop across
the cathode resistors. Of course check the power supply. I
am assuming this TX is similar to the T4XB.

Bob-

I have done several complete restorations of radios and TV sets from the 1940s through 1960s, as well as years of testing and repair of newer but heavily-used equipment. I approach things in terms of long-term reliability rather than just basic repairs. I would divide things roughly into three eras: 1950s and older, 1960s, and 1970s and newer. The oldest group has mostly or all wax-paper capacitors, and I replace EVERY one of those as well as EVERY electrolytic capacitor, before even plugging the device in. 1970s and newer (solid-state) devices have much more reliable parts in general and few if any parts of this age need to be replaced before a first power-up. 1960s equipment (or newer tube-type) is in between, and that is where many Drake radios fit in. This group also has mostly reliable parts, but the electrolytic capacitors are old enough (and can cause enough damage if they are bad) that I would consider replacing all of them as well (definitely the big ones in the power supply), right from the start.

After the advance repairs, I power up a device using a current meter in the AC power line to watch for immediate problems. (The "light bulb" device is for a similar purpose.) If I wanted to be REALLY careful, I might use a variable AC transformer (Variac or similar) and ramp up the voltage while watching the AC current, over a few-minute period. NOT spread out over hours, much less days(!). Then, just fix whatever problems appear by normal methods.

I believe the "slow Variac" people are trying/hoping to "re-form" old electrolytic capacitors with the gradual increases of voltage into them. I would never bother doing this. Even if any electrolytics are "saved" by this method, they can still go bad again (including shorting) at any time in the future, maybe taking the power transformer or other parts with them. It is just not worth the bother or risk, in my opinion.

I use an ESR meter constantly when repairing newer devices whose electrolytic capacitors go bad from the heat of 24-hour operation, but on older equipment, there are fewer of them in the first place (and maybe they should all be replaced anyway as mentioned above). I have never used my ESR meter on a tube-type device.

73-

Yup - it's going to be a bunch of repairs, and that's why I'll document it. I have NEVER seen a PTO this loose! I'm surprised the ball bearings are still in there.

Try cleaning the switch and lubricating the detent
first. I don't remember exactly how this switch is
constructed but most have a sort of scalloped surface the
ball runs in and a spring to load the ball. If the spring is
weak the detent action will be weak.
The PTO is the same problem I asked about several days
ago, there is an Allen head screw that adjusts the loading
on the single ball that holds the back end of the shaft. If
there is really a lot of play the ball may have fallen out.
Its probably a standard size ball so if its missing one can
be had from many hardware stores. Garey or someone probably
knows the size.
Lack of indication on the meter might be a bad meter,
bad resistors in the measuring circuit, bad tubes (really no
current). You should be able to isolate this with a plain
VOM. I would start with the meter with the set turned off.
If it deflects with the ohm meter put across it its OK. You
can check the tubes for current by measuring the drop across
the cathode resistors. Of course check the power supply. I
am assuming this TX is similar to the T4XB.

Steve
if you are interested in analizing the cap I can do it . with small capacitors like that there are onlt 2 tests , value and leakage/shorts
You can test for shorts with any VOM . metal film caps rarely short so it is most likely open . a.01 is too small to test for metre kick with a VOM . I still have the LC103 from when I ran a TV repair business .

EVEIN IF it has been re-capped. :D Plenty of other things can fail, too.

The exception that I make is for my 7-Line. I've been known to leave it on for days at a time, but then, it doesn't have tubes and high voltage.

13994. R-4B Switcheroo!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-27 21:52:33 UTC
From: Steve Wedge
Topic: 13994 Message: 13994

I took the covers off both R-4B's and have changed my mind. I'm going to sell the one I just finished. The main reason is the late s/n of the one I've had in my station, the fact that it has the same drift suffix as my transmitter and, most importantly to me, it has the G-10 boards instead of phenolic. Only two boards in my station receiver are phenolic and all the rest are G-10.

So, here's what I've got - and the price will be about the same because otherwise, it was hair-splitting.

R-4B, serial 13533B. Chassis is decent but not pristine - about 75th percentile. Only real corrosion is under the PBT, for some reason. Bottom cover nice but no silkscreen, top cover decent but very minor dents in two places where equipment was stacked on top of it at one time. Front panel is excellent with a couple of small scratches in the PTO window that can be seen if you look really carefully. Knobs are like new. No holes, no mods. Plays just like new.

I re-capped this set with the Hayseed kit. I replaced all the 12BA6's and the 6BZ6, plus C126 (natch!). This set was disassembled and thoroughly cleaned. After cleaning, it got re-assembled, new lube on the PTO bearings and the PBT, as well as oil drops at other moving parts (NOT the ball-drive!). Some Cramolin went onto the switch contacts to clean them up. The set was aligned and I ran it with my T-4XB at W1ES over the weekend. If you A/B'ed this and my other R-4B, you could not tell the difference.

I now have pictures available of this set. I'll let it sit for a couple of days before going to auction, in case anyone from the group is interested. Please contact me off-list for details and photos.

Thanks, Fred. I've been trolling around eBay and it looks like I may join the 21st century and buy an inexpensive LCR meter plus an inexpensive ESR meter. I see that there's a guy in VE who is selling the latter for around 40 bucks, ID'ed as a Model 2501A ESR Meter. Anyone work with these who could comment? I like the idea of this, as I can use it in-circuit to ID sets that really need to be re-capped.

I did a couple of quick inspections today. My R-4B for some reason had an "A" top cover. As luck would have it, this T-4X had a "B" top cover. A little cleaning, a little Mother's car way and - voila! Two rigs with problem covers no longer have problem covers

It appears all of the balls are present in the race. While I was dubbin' around in there, I took my trusty Fluke 8024, put it on diode check and touched the meter terminals. Nothing. That explains the "no idle current" part.

I just bought some 6JB6's for a good price on eBay and am waiting for those. I know I have at least one transmitter that's going to need them. This T-4X is cosmetically very nice but is going to take some work to get up to scratch.

I have to decide if this one's next, or the R-4C. The R-4C is as deaf as a haddock - only the strongest signals are copyable and I'm hoping it's NOT the roofing filter that's to blame. I don't have any other filters in it, so can't check that way.

My station R-4B is sitting here, chugging along on 17m, listening to a fine opening to EU. I did a little more cleaning of the bandswitch contacts today and I no longer have to jiggle the bandswitch to get strappin' signals! (I'd just been too lazy to do this until today - when I removed the covers to decide which R-4B to sell).

Anyway, when I start on the T-4X, I'll start shooting some phone pix.

13999. Re: [DrakeRadio] Restoring vacuum tube equipment after long storage.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-28 02:06:55 UTC
From: Garey Barrell
Topic: 13981 Message: 13999

I had three 4-Line sets running 24/7 for almost sixyears in the 70's in autostart RTTY. 170 shift on 14.075. There were about six of us.
One of the group was Irv Hoff, W6FFC. He was a Captain for United Air Lines, based in CA, and I was working with NASA in Huntsville, AL.
90% of our communication was via RTTY and 'time shifted) as we were never around at the same time.... Irv was a prolific typist, and could
type for hours at the 60 WPM speed we were using. I'd come home from work and there'd be paper ALL over the floor, literally. I finally
got a paper winder on the back of my M-28 ASR in self defense. One of our projects was the NAVMARCORMARS CATC system. It was designed to
route military traffic by decoding callsigns and routing through various stations. Sort of an early packet system!

Irv designed a series of RTTY converters, published in QST, over several years. The last was the ST-6, which in spite of my efforts to
convince him otherwise, ended up with a 'parent board' across the back with about 6-8 plug-in cards. Sound familiar?!??! Of course the
backplane was hand wired, and a real dog. So when we needed a converter for the CATC (Computer Automated Traffic Control) I put the whole
thing on a single 6" x 6" PC board, just to prove my point. We used that and published it in HR, even sold a few kits. CATC never took
off, all that TTL SSI logic just got to be too much for the digital. We had the only common suffix MARS calls ever issued, K4OAH was N0OAH.

OH, got distracted. I had a single failure in the 4-Lines over that time. One 12BY7 filament opened up. This was running RTTY at full
power (AFSK/SSB) with small fans on each R-4(any) and T-4X(any).

From: Steve Wedge
Topic: 13981 Message: 14000

Great story, Garey.

Actually, the most catastrophic electronics failure I have ever witnessed was in the power system of a DECSystem-20, back in 1977 or '78. There was a three-phase, 12V @ 390A power supply (using ferroresonant transformers) that fed the regulator banks for the ECL logic. The machines were supposed to be PM'ed periodically, but this one missed out, apparently. One of the things that needed to be done in the PM was to re-tighten the heavy cables that ran from that raw supply to the 3-farad capacitor bank. Well, vibration had loosened enough of the 1/2" kep nuts (yes - half inch!) that the thing was sitting there arcing and heating up. It finally caught fire one morning and one of those 100 lb. CO2 extinguishers-on-wheels was emptied into it.

This computer was used as a tester for other DECSystem-20 products and so was capital equipment. It took three of us a couple of days to get everything re-built. Low voltage, high-current.

73,

Steve Wedge, W1ES/4

Time flies like an arrow; fruit flies like a banana.

All my computers have my signature with various pearls of wisdom appended thereto.

From: Garey Barrell

Subject: Re: [DrakeRadio] Restoring vacuum tube equipment after long storage.

I had three 4-Line sets running 24/7 for almost sixyears in the 70's in autostart RTTY. 170 shift on 14.075. There were about six of us.
One of the group was Irv Hoff, W6FFC. He was a Captain for United Air Lines, based in CA, and I was working with NASA in Huntsville, AL.
90% of our communication was via RTTY and 'time shifted) as we were never around at the same time.... Irv was a prolific typist, and could
type for hours at the 60 WPM speed we were using. I'd come home from work and there'd be paper ALL over the floor, literally. I finally
got a paper winder on the back of my M-28 ASR in self defense. One of our projects was the NAVMARCORMARS CATC system. It was designed to
route military traffic by decoding callsigns and routing through various stations. Sort of an early packet system!

Irv designed a series of RTTY converters, published in QST, over several years. The last was the ST-6, which in spite of my efforts to
convince him otherwise, ended up with a 'parent board' across the back with about 6-8 plug-in cards. Sound familiar?!??! Of course the
backplane was hand wired, and a real dog. So when we needed a converter for the CATC

(Computer Automated Traffic Control) I put the whole
thing on a single 6" x 6" PC board, just to prove my point. We used that and published it in HR, even sold a few kits. CATC never took
off, all that TTL SSI logic just got to be too much for the digital. We had the only common suffix MARS calls ever issued, K4OAH was N0OAH.

OH, got distracted. I had a single failure in the 4-Lines over that time. One 12BY7 filament opened up. This was running RTTY at full
power (AFSK/SSB) with small fans on each R-4(any) and T-4X(any).

We had something similar, but not as spectacular: A video frame synchronizer (Holy Cow! They can put a WHOLE FRAME of video in 16 boards full of 4K ram))
Switching supply; 5V @60A, and one of the bypasses failed. Struck an arc and burned a 2" hole in the memory board. We don't need no steenkin' fuses on each board!

Yes, but the radios (among other things) were much younger then. Given the age of the radios now, and the scarcity of some of the components, I don't leave tube gear running unattended. The 7-Line is a different story, I frequently leave it run for extended periods.

The 14.075 RTTY autostart operation was quite interesting to me at the time. With a homemade ST6 built on perf board and a Drake 2A receiver I would also have piles of paper on the floor after coming home from work. By the way Gary, I was also working at Marshall at the time and living in Decatur, AL.
I was in Navy MARS at the time and would pick up traffic from the 6th Navel District RTTY net in the afternoon to the Alabama net in the evening. The Navy would send up paper 12 rolls at a time.

TR7 - early serial number with PS-7 $600
MN2700 Tuner $200
L7 Amplifier with PS $900
RV7 VFO $200
Drake Desk mic - $50
Service Manual - $20

All with original manuals - price is less shipping

From Estate of W5ALI - All proceeds go to his XYL

From: Steve Wedge
Topic: 14007 Message: 14007

I've noticed that the plugin crystals - both the regular bands and accessories, seem to go bad a lot. I just sold one that was working, sent it in lots of bubble wrap and it was doa. I've got a pile of about half a dozen dead rocks from as many radios.

Has anyone else noticed this sort of failure rate? These seem to be bad more than even tubes. Is it an age-related issue? Why don't the carrier oscillator xtals seem to go bad?

Steve -

That has not been my experience. Yes, they age (up in frequency, sometimes several kHz) but I don't see that many actually fail. A
shortage of gain in the oscillator can cause that, but I'm sure you've tried them in more than one radio.

As for the CAR OSC crystal, it's at 5 MHz, and so is a much larger, more rugged chunk of crystal than 20 and 30 MHz 3rd overtone types.
Especially dying after shipping. Complete failure would almost certainly be a mechanical problem, fractured crystal, broken weld, etc.

Is there a similar capacitor in the R-4C?

I'm experiencing similar symptoms

I think the crystals in the (older-?, 4x-Line?) Drake equipment are of the soldered can type.
I somewhere read a story that this process of sealing the cans is prone to failures over (longer) time caused by the fumes resulting from the soldering process.
These are said to contaminate the crystal lattice structure and can cause a crystal to fail.
That's why they switched to welding the the cans to avoid this.
So if ordering new crystals for the Drake equipment it would be best to ask for the welded type product.

Wes -

I'm not saying this wasyour problem, but MANY 'bad crystals' in 2-B receivers are the result of the poor quality of 6U8 tubes. A 6EA8
subbed in will often 'fix' many of those bad crystals.

Hi Garey
I did take your advice and installed a 6EA8. The bad crystals did not oscillate, but now the new ones do not have the 6U8 to contend
with. The 6EA8 works fine with the new crystals. Thanks for your advice.

Yeah, that's what I'm figuring. My first set of Twins I bought in NC, back in '07, had two bad crystals. At least a couple more R-4B's have had dead ones, a TR-4 I haven't started working on yet has a bad 15m, T-4X had a bad 15m, another Twin with a bad 15m and others pulled from accessory sockets have also been duds. I find I'm changing crystals almost as much as I'm changing tubes!

I suspect there's no real way of repairing these without specialized equipment, is there? I'd have to get the case off first - Bernz-O-Matic? Might be instructional if nothing else

Hi Steve,

Knock wood - I have 2 1960s era R4Bs, a T4Xb, and T4X and all the xtals and some extra band xtals are still oscillating OK.

However,for another application some time ago, I recall carefully un-soldering a bad xtal can cover, and found that one of the tiny finger grab spring clips holding the xtal wafer slipped off and had an intermittent connection where it "bites" onto the xtal wafer. I carefully repositioned the finger grab on the xtal wafer scratching in a new connection on the tiny land, re-soldered its cover, first around the base - let it cool, and then solder sealed the tiny hole on the top side of the can to avoid vacuum problems and it worked.

I must admit that I tried it on another occasion and it didn't work. But, if it doesn't oscillate to begin with, you haven't lost anything if you don't succeed in attempting to find the problem and repairing it.

73 Hank N2MU ...-.- ..

There is a way to test crystals with a GDO. This will tell you if the crystal is broken or if you have a circuit problem.

A few years go I purchased a set of 4 Line Twins. All the original crystals have been working fine. I have purchased additional crystals from Bry Carling and they all work fine.

Steve
I used a heat gun purchased from harbor Freight for about $8.00 to get cans off my bad crystals. Easy to do. Also used it to open the
bathtub capacitors in my SP600 receiver. Worked like a charm. (I did not try to repair bad crystals- they were cracked).

I dut cut a defective 15 meter crystal open with a small hacksaw around
the edge, soldering did not work for me.
Nothing obvious to see, not broken, no suspect coloration or whatever,
everything looked just fine
Cleaning didn't help.
Gave up, the crystal of course had lost by then it's (nitrogen?)
protective gas filling already.
I was just curious, like you ;-)

14026. Re: [DrakeRadio] Crystal reliability.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-29 16:35:24 UTC
From: David Winfree
Topic: 14007 Message: 14026

In the old days, I used a Hewlett Packard 4815A to look at basic crystal parameters, the key one being series R equiv. The 4815 is long obsolete, so you can find these for sub $100. Sometime in the late '70s, production crystals started using resistance welded cases, moving away from soldered cases. THose will present a issue for dissasssembly. I don't know exactly what backfill gas was used, but I'm thinking He to aid in leak detection, or at least dry nitrogen. I'd be reluctant to use basement air inside the crystal for best aging life. It doesn't take even a visual corrosion product to move a xtal resonant freq.

14027. T-4X RF Tune power output problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-29 17:08:28 UTC
From: WA8RVD
Topic: 14027 Message: 14027

I have an early T-4X
Loads up with full power in 7.0 position but only when RF Tune is in
80 meter area -- loads up in 14.0 position with RF Tune in 40 meter area. I haven't checked the other bands. I am just getting started on this thing; it came with no tubes but PA; I have cleaned all the switches and replaced the tubes and electrolytic and paper caps and rebuilt the ac-4. Seems like this should be obvious but my old head is befuddled! This is my first Drake xmtr.
Hope someone can help head me in the right direction.

From: David Winfree
Topic: 14027 Message: 14028

I've been down this road before on a T4X. In my case, I was actually transmitting out of band, due to a missing oscillator. Check the Tx output freq.

14029. Another chapter in the *life* of my TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-29 21:21:36 UTC
From: Howard Traxler
Topic: 14029 Message: 14029

Garey,
No real progress with the TR-4, but I thought I'd let you know:
A friend came over with his tube tester and tested the tubes in my TR-4. There were five tubes that woren't on the chart in his tester
6ej7
6ea8
13de7
6gx6
and 6ev7
So those didn't get tested. The rest of the tubes were in the questionable range.

The most questionable one was the ob2. Under test, it displayed a purple glow and some visible and audable arching and measured 15 of 100 percent . So now I think I'm looking for someone with a newer (or older) tube tester.

It would sure be nice to have this thing off my bench. If I could get anything for it, I'd just sell it as is and let someone else worry about making it work. it's getting a bit frustrating.

73.

I don't think nitrogen would have offered anything - after all, our atmosphere is about 80% N.

I'll open these in case there's something, as they say in Boston, "wicked obvious" upon removing the can. I'm gonna chuck 'em anyway, so I have nothing to lose...

Subject: Re: [DrakeRadio] Crystal reliability.

I dut cut a defective 15 meter crystal open with a small hacksaw around
the edge, soldering did not work for me.
Nothing obvious to see, not broken, no suspect coloration or whatever,
everything looked just fine
Cleaning didn't help.
Gave up, the crystal of course had lost by then it's (nitrogen?)
protective gas filling already.
I was just curious, like you ;-)

Howard,

I'm having e-mail server issues again, therefore this may post several times; my apologies.

If you decide you want to sell the TR-4, I would be interested in acquiring an additional unit.

You may contact me off the list at dcoffman@... if you would like to discuss the unit. I can also provide my cell phone number.

Regards,

Doug - N9XTF

When I was involved with space electronics in the 60's and 70's we used to pump out all the normal air the fill the units with dry nitrogen.

FT-243 crystals have nothing but normal air in them.

Not sure if the original HC6-U crystal cans were gas filled or just
vacuumed, but the later resistance welded HC25-U crystal cans were
definitely filled with nitrogen gas because of it's inertness.

My 15 meter cut-open crystal looked like the one in this photo:

Not sure if the original HC6-U crystal cans were gas filled or just
vacuumed, but the later resistance welded HC25-U crystal cans were
definitely filled with nitrogen gas because of it's inertness.

My 15 meter cut-open crystal looked like the one in this photo:

http://farm6.staticflickr.com/5459/8884766338_0242fd4c03.jpg

Topic: 14029 Message: 14038

The 0b2 is supposed to glow, it should not arc.
I suspect that he had the tester set up wrong-the gas regulator settings
are usually done in a rather strange way.
If he did not follow the SPECIAL instructions, then the result is probably
wrong.
Those tubes are usually long-lived.
However, a replacement for it will probably be fairly cheap.
the other tubes that he could not test-if there is a socket to fit it,
there probably is a way to test them.
Generally supplements were issued to add newer tubes.

Hi All:
I wish to thank Steve, Garey, Paul, Chris and Jim for there informative replies to my question. Much food for thought. I will be rereading this information. My Drake equipment has been out of service since 2004. I have lots of older gear to practice on first. I think this is going to be a long process.

73, Bob W2DSB

I think its to prevent oxidation. Dry nitrogen is
relatively non-reactive. It can be made very free of
moisture and of oxygen so there is little in the crystal
container to react with either the quartz or whatever is
used for the electrodes (commonly silver).
I don't know what makes older crystals fail but I've
encountered some dead ones. It can be whiskers forming on
the plating or broken contacts. Crystals can also break.
The very old fashioned crystals which came in loose
mountings could often be cleaned and many still work after
seventy or eighty years. The problem is that they are not as
stable as the newer variety.
I have not had a failure of a crystal in a Drake rig but
have had to replace crystals in a Collins R-388 due to
excessive drift and the standard crystal in my ancient
Measurements Corp 111-B died. I replaced that one with a
miniature crystal off ebay. I bought a package of five for a
dollar or something like that and chose the closest one.
The original was made by McCoy, who also made very good
crystal lattice filters. I tried to open it but I think the
case was welded.
I test crystals for activity with a Millen GDO.

Mike -

Your problem is in the BAND oscillator. Since ONLY 80M works, most likely culprit is a dirty crystal switch section of the BAND switch.
This is the one over by the crystal bank, driven by the right angle drive of the main BAND switch.

Some DeoxIT on those switch contacts, and a little switch exercise, should clear it up. Make sure the shaft coupler is tight and that the
crystal switch is actually turning. Close inspection of the area would be a good idea, just to see that everything is as itshould be.

When transceiving with the R-4A, the R-4A provides not only the PTO, but also the BAND signal, and the PreMixer signal.

On 40M, with the 18.1 MHz crystal NOT operating,it is possible to tune the RF TUNE to the 5.645 MHz CAR OSC frequency.

You say 'R-4A works using PTO in T-4X', but I think you mean the other way around. IF this statement is accurate, I think you'll find that
the transmitter is NOT working on 80M, but is also on 5.645 MHz. ??

Thanks Garey and everyone else who responded,
I have cleaned the bandswitch (but not with deoxit) and that may be what got 80 meters to work. Ordered some Deoxit yesterday (and some transistors and a tube just in case). I also have some other xtals I can try. The R-4A works when connected to the T-4x and the T-4X works with the R-4A (but only on 80 meters).
I need to make more room on my bench! Also working on an RME 69 and a Ranger 1 - the Drake is "new" technology to me. I would be lost without your CD's Garey - I highly reccommend them!
Thanks and 73,
Mike/WA8RVD

From: Garey Barrell
Topic: 14027 Message: 14047

Mike -

Well, you've managed to confuse me completely now.....

IF the R-4A works (all bands) when connected to the T-4X (Assume you mean in TRANSCEIVE, XMTR control.?)

and IF the T-4X works with the R-4A in TRANSCEIVE in RCVR control, something is fishy.....

The T-4X PreMixer subtracts the PTO frequency (5.455 @ '000') from the BAND frequency of 18.1 MHz (40M) to result in 12.645 MHz PreMixer
output. This is mixed with the CAR OSC at 5.645 MHzin the 1st Mixer, outputting 7.000 MHz.

The R-4A PreMixer is exactly the same as above, except the 12.645 MHz is applied to the 1st Mixer, where for a 7.000 MHz input the IF output
results at 5.645 MHz..

Obviously BOTH the PTO and the BAND oscillator have to be present to generate that 12.645 MHz PreMixer signal in either unit. This signal is
what is passed back and forth along the INJ cable between the twounits.

Under RCVRcontrol, the T-4X PreMixer is disabled by switch contactsand the PreMixer signal from the R-4Ais applied to the 1st Mixer in the
T-4X.

Under XMTR control, the PreMixer signal, along with a control bias, (~-30V) is sent to the R-4A along the INJ cable. The -30V disables the
R-4A PreMixer and the T-4X PreMixer signal is applied tothe 1st Mixer in the R-4A.

Obviously if either the PTO or BAND oscillators are not present, there is NO 12.645 MHz PreMixer signal. When connected together, only ONE
PreMixer signal is required. IF the R-4A works on all bands, the T-4X PTO, BAND and PreMixer stages are not requiredfor all band operation.
Vice versa, if the T-4X works on all bands, the R-4A PTO, BAND and PreMixer stages are not required.

14048. Re: T-4X RF Tune power output problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-30 17:23:20 UTC
From: WA8RVD
Topic: 14027 Message: 14048

Hi Garey,
The T-4X works the same whether under rcvr or xmtr control. It still only transmits on 80 meters with rcvr control (shows power out at 5645 kc on 40m and 20m with RFtune in 80m area). The R-4A works fine with xmtr control. The Xtal switching part of the bandswitch shows continuity in all positions. Could someone have fiddled with C-97 so that the oscillator only works on 14.1 mc? (80 meters). I have tried a known good 25.1 (20 m) xtal and still no joy on 20 meters.

There would have to have been a lot of fiddlin'. This sounds like bad contact to the common wiper of one of the switch wafers.

Steve Wedge, W1ES/4

Mike -

OK. Well, we're looking in the wrong place then. The fact that the R-4A works on all bands with XMTR control tells us that all of the
PreMix signals, BAND and PTO are present and working in the T-4X. This of course assumes that the output power you are seeing on 80M _IS_
80M and not 5.645 MHz. I also assume you do not have a scope available.

One possibility is that someone has pulled the Band switch shaft and replaced it with one or more wafers out of sync.

Are the slugs in the RF TUNE rack coming to the right dimensions for each band.?

Most likely the discrepancy is right at the 1st Mixer. Do T3 and T6 peak as they should per the alignment procedure, with the RF TUNE in
the 40M position? I usually work on the 40M band with a non-responsive transmitter. It's well away from the CAR OSC, fairly broad in
tuning, and no worries about neutralization or oscillations.

Since you don't have a scope, (?) Iwould start by looking at each bandswitch wafer, and using the capacitor IDs on the CD determine if when
the BAND switch isin the 40M position, the correct coil & trimmer are selected. It only takes ONE wafer out of position to kill the
transmitter.

Anyway, the problem is narrowed down to something between and including the 1st Mixer (V3) and the Driver (V4), and possibly the PA (V5 & 6).

If all the above checks out, I would next try the alignment steps associated with 40M, e.g., see if the appropriate trimmer caps peak as
they should with the RF TUNE control in the correct spot on the dial. Keep one eye on the output or PLATE meter(s) as tuning a trimmer cap
can make the plate current go from 0 to full scale in an instant, and the PLATE control must be dipped immediately toprotect the PAs.

Mike -

I forgot to mention, you can also use a separate receiver to listen for the signal at 7.000 MHz and peak the appropriate caps to see if you
can make it stronger! Again, keeping an eye on the PLATE meter. You should be able to hear the 18.1 MHzand the 12.645 MHz signals ona
general coverage receiver.

C97 was only used inthe first version of the T-4X. C96 was replaced with a 35 pF. I would tweak it to make sure the oscillator started
reliably on the upper BAND crystals. Again, the BAND oscillator IS working if the R-4A works under XMTR control....

Steve -

The problem doesn't seem to be inthe BAND oscillator. The R-4A works on all bands under XMTR control in transceive. Ergo the BAND
oscillator in the T-4X IS working on all bands.

Garey
I have an SDR receiver so I can find my signal. The bandswitch wafers line up OK. I have a scope but unfortunately I lent it to someone. If my wife lets me; I'll play with it tonight! Thanks again for your help.
Mike

A quick thought although a bit far fetched, look for
loose or bad solder joints on the switch or around it. I
have found unsoldered wires in both Drake and General Radio
equipment. Poke at the wires with an insulated stick. A
wooden chop stick works. Watch out for some adjustment tools
that look like they are insulated but have some conductivity
probably to eliminate static charges. They conduct enough to
bite you if you get onto high voltage.

Steve -

The problem doesn't seem to be inthe BAND oscillator. The R-4A works on all bands under XMTR control in transceive. Ergo the BAND
oscillator in the T-4X IS working on all bands.

Yeah, V3, 4 are most likely.

Be interesting to see if he can hear 7.000 MHz and if the adjustments around V3 peak. Both stages seem to work on 80M, so it almost has to
be V3, 4 and their AC (resonantor switching) behavior.

Date: 2013-05-30 21:16:42 UTC
From: WA8RVD
Topic: 14027 Message: 14057

Well, I tried transmitting on 40 meters while watching for a signal on my SDR-IQ. Adjusted all 4 7.0 trimmers and no sign of a signal. All 4 trimmers were all the way to the right to start with. V3 V8 & V4 all check out Ok on an EICO 666.

14058. Re: [DrakeRadio] Re: T-4X RF Tune power output problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-30 21:34:20 UTC
From: Garey Barrell
Topic: 14027 Message: 14058

Transmitter is disconnected from R-4A, transmitter keyed in CW or TUNE, GAIN turned up to about 10 o'clock, RF TUNE peaked around 40M mark,
PLATE and LOAD at 0. Are you saying that someone has already 'tightened all the loose (adjustment?!) screws? :-) They should all be about
2-3 turns loose. May be difficult to find if they're all too far off. The INJ trimmersshould peak the PreMixer below, the RF
trimmersshould peak the 7.000 MHz.

You should be able to set the PTO to '000' and hear 5.455 MHzaround the opening in the bottom of the PTO.

You should be able to hear 18.1 MHz with the BAND switch on 40M around the BAND oscillator. -Make sure theXTALS switch is at NORM!

You should be able to hear 12.645 MHz around the PreMixer (V8) Plate.

You should hear 12.645 and 5.645 MHz around V3 Grid, and 7.000MHz around the Plate of V3.

73, Garey - K4OAH

I have everything except the 7.0 mc. The 7.0 trimmers were already full clockwise!

You may need to back out the preselector a bit and try retuning. Don't forget that 40 is tuned at 7200, IIRC.

Steve Wedge, W1ES/4

You gotta back them off 3-4 turns. Middle of the range! Tight is NOT maximum signal, they have to be tuned to resonance!

From: Garey Barrell
Topic: 14027 Message: 14062

WE want to stay at 7000 so we're looking in the correct place. Yes, thealignment is at 7200, but that's when everything is working.

MIKE - does adjusting the RF trimmers affect the 7.000 MHz signal at all??

If not, you may have an open coil.

14063. PTO ground strap mod

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-30 23:37:31 UTC
From: Richard Knoppow
Topic: 14063 Message: 14063

I saw this again in the notes in Garey's B line disc so
decided to try it. Its very simple to do. I used a length
of solder wick. Not sure what benifit its supposed to have
but did it anyway. After adjusting the end bearing the
other day, which made the tuning feel very solid and
precise, I decided to follow up and make sure the mechanism
was clean and properly lubricated. I had observed in the
past a slight tendency for the PTO to hunt. The change in
frequency was slow and slight but I think was there. Not in
a fixed direction but back and forth. Not sure if anything
I did helped but it does seem more stable now.
I compared it to the PTO in the T-4XB when using that
for receiver control, it seemed to be more stable. I think
my T-4 is newer than the R-4B. We are talking about maybe
ten or fifteen hz of drift, hard even to detect but I have
a sensitive ear for it.

From: Barry
Topic: 14063 Message: 14064

Not sure if this is apples-to-apples, but the PTO in an R390A has a ground strap that, if not making a good connection to the PTO's shaft, will cause the PTO frequency to "warble". It's a common problem with a simple fix that sounds similar to what you're describing.

Regards,
Barry - N4BUQ

14065. T-4XC - no 160

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-31 01:06:55 UTC
From: Steve Wedge
Topic: 14065 Message: 14065

I've got a T-4XC on the bench, nothing beyond idle current on 160m. Receives fine with either TX or RX selected. I don't see any burnt contacts, no shorted capacitors good contact through all switches. The trimmers are not shorted, and adjusting the trimmers for the driver grid and plate do nothing.

No signal at all at the driver grid trimmer and I can see a robust signal on the 80m trimmer when I'm on that band.

Bad cap? Need to find some parts...

Steve Wedge, W1ES/4

And with FT-243s, you could unscrew the case and fine-sand it to raise the freq or run a #2 pencil over it to lower the freq or vary the pressure on the stalk for a little VXO action. Who says we had primitive technology back then... Bob, NZ5A

I don't think nitrogen would have offered anything - after all, our atmosphere is about 80% N.

I'll open these in case there's something, as they say in Boston, "wicked obvious" upon removing the can. I'm gonna chuck 'em anyway, so I have nothing to lose...

Subject: Re: [DrakeRadio] Crystal reliability.

I dut cut a defective 15 meter crystal open with a small hacksaw around
the edge, soldering did not work for me.
Nothing obvious to see, not broken, no suspect coloration or whatever,
everything looked just fine
Cleaning didn't help.
Gave up, the crystal of course had lost by then it's (nitrogen?)
protective gas filling already.

I was just curious, like you ;-)

14067. Re: T-4X RF Tune power output problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-31 01:20:41 UTC
From: WA8RVD
Topic: 14027 Message: 14067

I'll try backing the trimmers off tomorrow . This is a nice looking radio but came to me advertised as "Not Working" , all the tubes were missing but the 6JB6's. It came with an AC-4 but the power cable had been gnawed almost in two by a large animal and then soldered and taped back together. Someone has obviously been at it with their magic screwdriver, too.
Since it works on 80 meters would that mean that the coils are OK?
When trying to transmit on 40 meters adjusting the trimmers has no effect when RF tune is in the 40 meter area but if you adjust RF tune to the 80 meter area then you get full power out at 5645 kc. Dip the plate, etc.
I'm lost!

From: Garey Barrell
Topic: 14063 Message: 14068

Richard -

There is quite a difference in frequency of the PTO depending upon how well and where the lead screw/tuning slug is grounded. Originally
the lead screw was grounded primarily via the 10 ball bearings in the front of the gearbox, and additionally via the fork resting on the
rider bar, held in relatively stable condition by the spring.

As the grease aged and picked up dirt, it became 'lumpy' and resulted in minute hops in frequency as you tuned, which 'usually' stopped when
you stopped turning the knob. People also insisted on oiling the rider bar, which, combined with the oiling of the lead screw/fork
interface, gave a less than consistent ground. Somewhere near the middle of the C-Line I guess Drake got tired of answering these questions
and promulgated a field change adding a small piece of braid, soldered to the fork and to the side wall of the gearbox. They even provided
the braid along with the instruction sheet.! This made for a solid, consistent ground, and was factory installed through the restof the
C-Line and into the 7 Line.

Steve -

You are aware that the 160M crystal was NOT standard. It's a 12.6, and needs to be installed in the ACCY XTALS bank, usually spot #1. It
also doesn't tune much below 1.8 MHz, at best. Later T-4X(any) had additional loading caps added but still not much below 1.8 MHz.

14070. Re: [DrakeRadio] Re: T-4X RF Tune power output problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-05-31 02:24:56 UTC
From: Garey Barrell
Topic: 14027 Message: 14070

Perfectly logical..... Sure the tubes (V3 and V4) in the right sockets! :-)

The coils are probably ok, there is enough 80M drive that it's conceivable the grid or plate circuit of the PreMixercould be 'untuned'. Have
you checked the DCvoltages on V3 per the conditions in the Voltage chart in the manual?

Turn the RF TUNE fully clockwise against the stop. The pointer will probably be a little bit past the 10 on the scale. The top edge of the
four tuning slugs should be exactly 9/16" above the top edge of the fiberglass coilform. Turn the knob fully counter-clockwise and the
pointer should be near 0. Split the difference with the gap at 10 so that the pointer is 'centered'. You can move the pointer by holding the
knob and pushing with a fingernail. Don't push too close to the panel or it will rub.

Nothing to be 'lost' about. First, the fact that it tunes to 5.645 MHz indicates that everything is working, it's just not getting the 'in
band' signal. I believe the problem is in V3 or its associated switch wafer and/or T6. Good tube?? Correct tube?? Socket wired
correctly?? You should have a good strong signal at 5.645 MHz -AND- a good strong signal at 12.645 MHz on the Grid of V3. T6 should tune to
7.000 MHz with C148 with the RF TUNE near the bottom of the 40M segment on its dial. Remember the PTOis set to '000', and you might have to
tune around a little bit (few kHz) to find the 7.000 MHz signal. If you can find any signal at all at 7.000, adjust C148 and see if it will
peak. If it does not peak, there is a switchwafer, T6, C148, C28, C31 etc. problem. Most likely a broken connection, bad switch contact or
short rather than a defective component. Visual inspection is very important here, comparing against the schematic. There are three T-4X
schematics on the CD, I don't think there are any differences in this area, but ...

WE have noidea what some genius may have screwed up while he was 'fixing' the T-4X up to sell it!!

Thanks Garey, I had cleaned everything and the PTO has
been pretty stable but I thought if Drake recommended the
mod I should make it. Very easy to do. I don't know if it
made any difference but I've had the set tuned to W1AW for
about two hours listening to the code practice and bulletins
and it has not moved. BTW, its a very good CW receiver.
While the IF should be broader than my RCA AR-88 its able to
reject QRM the AR-88 hears quite well.

The answer is probably in the list archives, I've seen
it discussed but can't remember the reason for the strap.
In any case I've been listening to W1AW code practice and
bulletins for about two hours while doing other things and
the receiver has not moved.

There's some anecdotal evidence that 40 Meter crystals in the later twins can are sligthly more prone to failure by going off frequency by 20 or 30 KHz. I have one such. My 2-A had a dead 10 Meter crystal.After the usual troubleshooting, I took the can off and it started to work. Put the can back on, and it was still working the last time I checked.

Shattered crystals are easy to diagnose, they make a nice sandy rattle when shaken.

Unless you need an automatic tuner, how about building one using the basic MN-2000 / MN-2700 design? An excellent unit, and quite versatile. Basically, a reversed Pi-network design, using a low-pass filter topology instead of the high-pass design common with most other units.

Or you could simply buy one from one of the on-line auction sites. They appear there with some frequency, and will in all probability cost less than buying the individual parts. .

These couplers work well with coax feeders, and I often use one with open-wire or ladder line by running the RF through a 4:1 balun connected to the coupler via a short length of R-8/U cable. Handles a 1500-watt amplifier with no problem whatsoever.

One of my better "all-band" antennas consists of a 90-foot doublet connected via about 75 feet of ladder-line. It will match all bands (80 through 10 meters) with ease, except for 160 meters. If I were to extended the doublet to perhaps 75 or 80 feet feet per side, it would work there too.

The MN-2700 (what I use) works on the newer WARC and 60-meter bands too, even though it is not directly calibrated for those frequencies. I just select an adjacent band, for example 17 meters tunes well using the 15-meter position, then adjust for best match. The units have more than enough tuning range to handle these "in-between" bands.

Tell us more about the type of antenna(s) and transmission line being used. If you are using mostly "full size" wire antennas on the HF bands, there's little need to go beyond an "L" network (or balanced "L") without the need for reversal. If the input to the feedline will not dip below 50 ohms, there's no need to utilize a "T" or any other form of network that requires tuning and matching to a low-Z.

Consider an 136 ft long dipole at 30 ft in height over average soil. Calculated feedpoint Z is 5353 -j1871 ohms. That's an extremely high and reactive Z since it is a full-wave on 40m. Even with a 1/4-wave 600-ohm line section, the Z at the feedline input is ~ 70 ohms -- still well above 50 ohms. A few years ago, I ran a model that calculates the input feedline Z of my 80m dipole when fed by 600-ohm line. Between 80m-10m, it never goes below 50-ohms, regardless of line length. There are many ops using lossy tuners where a simple two component network will get the job done and have the benefit of knowing that only one setting will get the match -- unlike the "T" where a match can be obtained at multiple settings but with varying loss. Sometimes it cannot be avoided in cases of phased arrays. Then, a T network may be required to achieve a match while controlling phase shift through the network. So, I suggest not using a tuner that can cover such Z extremes if you're using simple, non-phased radiators of reasonable length.

Companies like Drake had to create tuners that would tune and match under a wide range of operating conditions in order to provide a "one size fits all" device. We continue to see that with popular tuners today. But adding such extreme flexibility comes at the expense of unnecessary losses. See measured data in QST product reviews as evidence of this. For my own operating, the Drake line of tuners, while well-built, would be among my last choice. Although not as "smart" looking on the desktop, it's pretty tough to beat the KW version of the Johnson Matchbox for a low-loss QRO device. You may hear negative comments about the Matchbox's limited matching range, but those limitations occur with antennas that are generally very short -- and of absolutely no interest to me. Since your interest is in a homebrew design, you may want to construct your own version of the Matchbox, perhaps using parts from a "beater" unit.

Another design worth considering is the balanced tuner described in QST by AG6K back around 1990. A motorized version of this design can be seen on my QRZ.com page. The manually tuned version can be easily constructed over a weekend.

Yup - the crystal's in there. Lots of signal through the premixer. I can see it with the scope at the front two trimmers and there's nothing at all for signal beginning with the driver grid. I'm suspecting a bad capacitor and will find out later today - I've got a T-4XB carcass and the parts are identical. Going to start with the grid circuit, since there's no signal there (I checked and can see a signal on the other trimmer when I put the rig on 80, so I know the scope isn't killing it).

I was initially suspicious of that small inductor on the switch wafer, but it is showing continuity when I disconnected the long lead to the transformer.

It'll be interesting.

Steve -

You are aware that the 160M crystal was NOT standard. It's a 12.6, and needs to be installed in the ACCY XTALS bank, usually spot #1. It
also doesn't tune much below 1.8 MHz, at best. Later T-4X(any) had additional loading caps added but still not much below 1.8 MHz.

Good morning,
I've made some progress! I did the first part of the alignment procedure (VTVM to T-3, sig gen to inj terminal and adjusted injection trimmers)and I now have output on all bands except 40 meters!
I got very, very little voltage at T-3 for 40 meters - just barely enough to be able to see a peak when adjusting the trimmers.
40 meters still gives no (zero) output at 7.0 mc but full output at 5645 kc.

I'm feeling better about this rig! But I NEED 40 meters, too! So what do I do next?
I really appreciate all the help - can't do this by myself, I guess.

Jim -

I've not seen a preponderance of failed 40M (18.1 MHz) crystals in the twins. The first crystal to fail in the 2-B was the 40M crystal
(11.0MHz), a failure that was often mitigated by swapping out the 6U8A with a 6EA8 (higher gain) tube. If you've ever looked at the BAND
oscillator in the 2-B, but it actually operates in two different modes, depending upon frequency. The 11.0 MHz crystal is 'on the edge'
between the two modes and I've often wondered if that had some effect.

As an aside, I'm hearing more lately from people saying that the twins tuning rate is too fast. I believe there are a couple of reasons for
this, not the least of which is the fact that the newer radios CAN BE set for ridiculously slow tuning rates! Ever since single knob (vs
BAND and Bandspread knobs) tuning came along, it's been a trade-off between setting a specific frequency, or more recently tuning in a
digital signal, or more recently still making _SURE_ that you are _EXACTLY_ on 14.260.000 MHz! At least on the dial! :-)

Anyway, the twins are 25 kHzper full rotation. Interestingly, the 2-B is approximately 40 kHz per rotation, almost HALF the speed of the twins.

Personally, I have no trouble tuning in anything with the twins, but then I developed a 'safe-cracker'stouch' on my BC-453 Novice receiver
which covered the entire (50 kHz) 80M Novice band in approximately 1/4 of a turn.!

Changed out the whole grid trimmer assembly - no change. I can't peak or even get any signal of any kind in the driver grid circuit.

Plenty of signal at the premixer trimmers (the two toward the front), which is consistent with the receiver being able to work off the TX PTO.

Aside from the trimmer/fixed caps - which I've already changed, the only thing to my eye that seems to be unique to 160 are T1 and T9 - which I believe are the two small solenoidal inductors at the very bottom of their bandswitch wafers and look like they're going to be nasty to get at.

Any places I'm missing before I dive in? Not really relishing this.

From: Steve Wedge
Topic: 14065 Message: 14082

I was getting a short at the contacts but I am going to try the Cramolin approach first before the major surgery route. I could have been reading the resistance of the coil rather than the switch...

Steve -

OK, just checking!! :-)

So the signal (1.8 MHz) is present at the Plate of the 1st Mixer (V3) but not at the Grid of the Driver (V4)?? Yeah, those incremental
coils were my first thought before I read all the way through. Switch contacts clean for the incremental coil??

> Yup - the crystal's in there. Lots of signal through the premixer. I can see it with the scope at the front two trimmers and there's nothing at all for signal beginning with the driver grid. I'm suspecting a bad capacitor and will find out later today - I've got a T-4XB carcass and the parts are identical. Going to start with the grid circuit, since there's no signal there (I checked and can see a signal on the other trimmer when I put the rig on 80, so I know the scope isn't killing it).

Mike -

Progress!! Do you have the 18.1 MHz BAND signal at Q3? Do you have the 12.645MHz PreMixer signal at the Plate of V8? Same at the Grid of
V3? Do you have ANY 7.000 MHz signal at the Plateof V3?

Yeah thought the ref des was funny but that's what's on my schematic. And yes, they're not even transformers!

Cleaned the switches and no change. I would think that I'd get some kick-up in plate current even if the trimmer was mistuned if everything else was working.

One of the coils does look to be "disheveled" but was showing continuity. Aside from the trimmers, those coils are the only thing I see that's unique to 160. Even of the tank circuit was roasted in that position, I would at least see a drive signal at the operating frequency.

I also took your recommendation and moved up to around 1900 kHz but that didn't buy me anything...

OK. Youdo still have 5.645 MHz at V3 as well.... If adjusting C128 has no effect, it has to be a problem with C128, C28, C31; switch
contacts on S-4(f) and (r), and associated wiring. IF you have a replacement for C28 or something close, you could bridge it across C128 to
see if it would then tune.

Steve -

WHY are you NOT using one of the schematics on the CD. Perhaps you need to compare to a 'correct' schematic!?!?

Don't have the c cd yet. Will have to rectify that when I get back home.

Hey Gary,
You said, "Somewhere near the middle of the C-Line I guess Drake got tired of answering these questions.."

Do you happen to know what the SN cut in was for the R-4C's that enjoyed the PTO strap "upgrade"?

OOps, my bad. I've been 'working' on three T-4Xs and just sawwhat I expected. Yes, they are (erroneously) marked T1 and T4 in the "C".
Frankly the quality of Drake documentation fell off considerably during C-Line production. Early schematics were clearly original drawings
while later ones were apparently photocopies that were edited, poorly.

Chris -

No, sorry, I never bothered to consider that. I know the early ones didn't have it, and the later ones did, but never tried to narrow it
down further! :-) It would be hard to say anyway, since so many were done in the field. I never bothered to do one except when I was
working on a PTO, and not always then.

My feeling is that the original scheme worked fine for over 20,000 PTOs for many years! The only time I have had a problem was when the
original grease was still in the front bearing and it had gotten 'crunchy'. In those cases I just cleaned out the old grease, relubed with
Lubriplate, and cleaned oil and grease from the fork and rider bar. In almost 50 years, I'm not aware of doing one more than once, i.e.,
I've never had a problem with one that had Lubriplate in it. That said, I certainly wouldn't argue against it.

If I was servicing for others, for money, I'd probably do it as a matter of course, but for myself I just haven't seen theneed.

In Garey's B line disc is a modification of the CW side tone in the T-4XB. What is the purpose of this mod? I have not yet looked to see if my TX has it.

OK, Garey
I'll see what I can find (or order one). Meanwhile; I've rebuilt the AC-3 for my old TR-3 which I've had since 1973 (my first SSB rig). Still works! and finished up my Ranger 1. Now I have some room to work!

I have a Drake 2B. The band switch is functional but changes bands not as smooth as I think it should. What can be done to make it turn more easily? Tnx for your input and suggestions.

I have often found that the grease has dried out or is missing on the detent at the back of the bandswitch on a lot of radios. I clean out the old stuff as best I can and replace it. I usually use the end of a toothpick to place a dab of grease into the cups for the detent ball.

I use a white lithium grease that I bought at a local hardware store. If the shaft goes through some bushings, you might also try a drop or two of Fader lube between the shaft and the bushing and then turn the switch several times. There is usually a bushing at the front of a bandswitch where it mounts to the front of the chassis. These often can build up some corrosion over time.

I have used Triflow PTFE (Teflon) based bicycle grease on detent balls. It works very well.

http://www.triflowlubricants.com/Tri-Flow_Synthetic_Grease.html

A 1/4-Oz. tube has lasted me three or four years, but is almost empty. I just ordered a 3 Oz. tube to keep going.

Boy, will you get a lot of different answers! This is
a low-load, low-speed application,.mostly it needs a grease
that won't dry out or oxidize quickly. Synthetic greases
are probably longer lasting than conventional greases but
even petroleum jelly like Vaseline will work. General
Cement has some stuff called Tuner Lub which is petroleum
jelly with a little anti-oxidant in it. I have some
aviation grease that was recommended in a Collins R-388
handbook. It has very long life and is quite slippery.
Mine is Aeroshell No.7 but the same stuff is made by all the
larger suppliers of lubricants. The detent ball needs very
little grease. You also should get some oil into the shaft
bearing. Here again conventional oil works fine but I have
some stuff made by Kano Labs, a light petroleum oil that
works well. OTOH you can use 3-in-1 20 weight machine oil
(in a Blue can, not the penetrating oil in the Red can)
which works perfectly well. The switch should have some
stiffness to prevent its being turned accidentally and the
detent action should be positive.
The old grease can be cleaned with dry Isopropyl
alcohol, Naphtha (or Ronsonol lighter fluid) or disc brake
cleaner.
Who knows what the original lubricant was.

Jerry -

New grease?!... :-)

Sorry, couldn't resist. White lithium grease, some of the hi tech bicycle chain and gear grease, or in most cases a drop of two of 20W
non-detergent motor oil will be fine. It's really not a spot that needs 'super lube'. Whatever you do, do NOT 'spring' the flat detent
spring by prying it up to lessenthe tension onthe ball. Destroys the detent mechanism. Also, PLEASE no WD-40, that's worse than NO lube.

Hi Garey,

On Fri, 31 May 2013 10:31:04 -0400, Garey Barrell wrote:

>I've not seen a preponderance of failed 40M (18.1 MHz) crystals in the twins.

I've seen maybe three or four reports of similar failures over the past few years, enough to thorw up a flag in my mind. Maybe I noticed it because I actually have one, but IIRC it seems to be C-line era 40 Meter crystals that sometimes do this. They operate just fine, other than being up to 30 KHz away from where they should be.

>As an aside, I'm hearing more lately from people saying that the twins tuning rate is too fast.

Hah! That's funny. If anything, it seems way too slow when you want to get to the other end of the band in a hurry. IMO, it seems to be a very good compromise between band surfing and speedy QSY.

>Personally, I have no trouble tuning in anything with the twins, but then I developed a 'safe-cracker'stouch' on my BC-453 Novice receiver
>which covered the entire (50 kHz) 80M Novice band in approximately 1/4 of a turn.!

And I was tuning SSB signals on a Hallicrafters S-120 when I was a broke teenager. Modern hams have it too easy....

True... Also withBAND switches consisting of 5 or 6 wafers, the drag of contacts on corroded wipers can add quite a big load. A good
DeoxIT of all contacts can sometimes work wonders!

Good to know that, too,
BTW, do you know the size of the self tapping screws used in the TR series to attach the HV cage to the chassis?

Bill -

True... Also withBAND switches consisting of 5 or 6 wafers, the drag of contacts on corroded wipers can add quite a big load. A good

DeoxIT of all contacts can sometimes work wonders!

Back on my Teflon kick again, I really like the PTFE-based oil that I have seen in the small "pinpoint oiler" pens at Ace Hardware, Radio Shack, and (oddly enough) Triflow. This stuff seems to work very well everywhere that I have tried it.

Jerry -

New grease?!... :-)

Sorry, couldn't resist. White lithium grease, some of the hi tech bicycle chain and gear grease, or in most cases a drop of two of 20W
non-detergent motor oil will be fine. It's really not a spot that needs 'super lube'. Whatever you do, do NOT 'spring' the flat detent
spring by prying it up to lessenthe tension onthe ball. Destroys the detent mechanism. Also, PLEASE no WD-40, that's worse than NO lube.

14113. Side Tone Mod

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-01 08:06:05 UTC
From: Richard Knoppow
Topic: 14113 Message: 14113

I may have found my own answer. I read through the
"Drakemod" document in Garey's CD. The mod is mentioned
there as a way to eliminate feedthrough of the CW side tone
in standby mainly on the T-4C. I don't have this problem on
my T-4XB so, unless its for something else, I will just
leave it alone.
BTW, if you have the CD make sure to read _everything_
in it. There is a lot of hidden wisdom that you will miss if
you just look at the instruction books and service manual.
If you don't have the CD _get it_!!!

Well, if it's already a dud, I can't possibly have anything to lose :)

Most of the older crystals had cases you could open, with screws, so I can take my chances...

From: Richard Knoppow
Topic: 14007 Message: 14115

The crystals with screws in them are mostly not plated
but are in sandwich holders. The crystals can be removed
and cleaned and the holder plates can be cleaned. If they
are dead or have low activity they are often just dirty.
They can be cleaned with alcohol. An enormous number of
crystals of various typed cam on the surplus market
following WW-2, the ham magazines of the time had many
articles about how to modify them for ham use. I don't have
specific articles in mind but a survey of the cumulative
indices of QST, etc, should find a bunch.
Crystals come in various "cuts" which have different
characteristics. The ones available now are often cut so
that they have virtually zero frequency shift with
temperature, some of the older crystals move around quite a
bit.

The Universal Link Antenna Tuner is a mechanically and electrically balanced tuner that will serve you for years. There are several circuits that may be used with open wire feeders, coax or single wire feed.

This link coupler shines while using balanced feeders. I read the "normal" link antenna tuner is a better choice than the Z tuner.

14117. TR-4 output issue on 40, 29, &15M

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-02 14:09:24 UTC
From: lonelyone_64109
Topic: 14117 Message: 14117

I have been working on a friend's TR4 as it had sat in storage for over 15 years. Once the bad tubes were changed out, all switches sprayed with DeOxit and the AC-3 recapped the rig is working and sounds pretty good. The audio output is a little low but he gets good reports on the air so it is not a big deal.The other day he brought the rig over for an output issue on 40, 20,and 15.

With the XMIT gain control fuly counterclockwise when you switch to the X-CW position the rig shows 350 mA on the plate current and full output, like it had already been tuned up which it hadn't been yet.On 80 and 10 meters the rig performs normally, running about 100 mA with the gain all the way down (not tuned up yet). You can tune the rig normally on 80 & 10M. However when you're set for 40, 20, or 15 the rig acts as if it had already been tuned.If you attempt to tune it naturally the plate current will increase to 600 mA which would destroy the finals in short order.I went down to 10M and checked the neutralization and it did not need to be redone (as far as I could ascertain). The full output problem occurs on both his AC-3 power supply as well as my AC4 (mine has the AC-4R board mod). I wonder if something is shorted (dirty switch or pot or even a neutralization issue?)as its been 4 months since I brought the rig back to life.Could possibly be something going into oscillation? Jim had mentioned hearing a tone (not the calibrator) on 40 but I wasn't able to recreate the tone.He might have been picking up a local birdie from some neighbor's home electronic gadgets. Lord knows all the things that are on the market that can cause RF problems.

I do remember when I first got the rig back up there was a sudden jump in plate current (to 600 mA) on either 40 or 20 (I don't remember which) and I took that to be a neutralization issue. Since the rig had sat unused for many many years in a less than ideal storage (unheated garage or damp basement)I expected a LOT more issues with it than what I found.

Cosmetically its a little on the rough side and the copper chassis is dirty topside and the case needs to be repainted. But if you look under the chassis it is a very clean radio with no signs of modification except for the fan mod I put in when I had the rig.He even has the DC mobile PS as well as the noise blanker (what I would do to have a blanker!!!) for the radio as it had been used as a mobile many years ago by another ham who sold him the radio.

I will be checking into the Drake net this afternoon as well to see what I can find out (propagation willing!).Thanks for your help.

73,
Paul WB0CJB

Paul,

Can you adjust the preselector and get the plate current to a safe level? The one that I rebuilt, the carrier balance and balance modulator alignment was way off. It was trying to transmit a carrier an SSB driving the current way up. As soon as I aligned it this went away.

For testing I was able to Detune the preselector TO bring the plate current down, adjust plate for dip and then tune everything for resonance to protect finals. I was then able to make the alignment changes.

Your symptoms are identical to mine but I may be incorrect for your situation. Garey and the others will have the correct solution shortly.

Paul -

Sounds like the PA (or even Driver) are oscillating somewhere outside the range of the matching networks. From your description it's most
likelyabad ground. Have you done the 'screwdriver on every ground lug or shield fastener, loosen and retighten' process yet??

With the GAIN at minimum, you should see, 'exactly' 100 mA, as that is the specified idle current for the PA tubes. Adjusted with the BIAS
control on the AC-3/4.

14120. ICM EX Modules

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-02 23:34:36 UTC
From: Garey Barrell
Topic: 14120 Message: 14120

I don't know if it was this group or not, but a while back someone was looking for information on the ICM EX 'Experimenter' modules.

I just came across an ad for them describing five (5) types.

If anyone is still looking or has any interest I'd be glad to forward the ad from Ham Radio magazine.

I haven't tried the "loosen and retighten every ground connection" but it does seem a possibility, given the dirty chassis. With it being stored in a damp garage or even basement its very possible the grounds has become corroded.I do remeber seeing that green color on some places so naturally thats an indication of corrosion.

I haven't gone in and done any realignment yet. At the time I didn't feel it was necessary due to the output it was showing. But I will check with Jim and see if he might have tweaked anything that could make it go into oscillation. I doubt that he has but I will check just to make sure. With the upcoming Field Day I will have to wait until afterwards to get the radio back and do these checks on it. Thanks for the input and I will let you all know how it comes out.

I can ask him on the way to work tomorrow morning on the local repeater.Thanks guys!!!

> > I have been working on a friend's TR4 as it had sat in storage for over 15 years. Once the bad tubes were changed out, all switches sprayed with DeOxit and the AC-3 recapped the rig is working and sounds pretty good. The audio output is a little low but he gets good reports on the air so it is not a big deal.The other day he brought the rig over for an output issue on 40, 20,and 15.
> >
> > With the XMIT gain control fuly counterclockwise when you switch to the X-CW position the rig shows 350 mA on the plate current and full output, like it had already been tuned up which it hadn't been yet.On 80 and 10 meters the rig performs normally, running about 100 mA with the gain all the way down (not tuned up yet). You can tune the rig normally on 80 & 10M. However when you're set for 40, 20, or 15 the rig acts as if it had already been

tuned.If you attempt to tune it naturally the plate current will increase to 600 mA which would destroy the finals in short order.I went down to 10M and checked the neutralization and it did not need to be redone (as far as I could ascertain). The full output problem occurs on both his AC-3 power supply as well as my AC4 (mine has the AC-4R board mod). I wonder if something is shorted (dirty switch or pot or even a neutralization issue?)as its been 4 months since I brought the rig back to life.Could possibly be something going into oscillation? Jim had mentioned hearing a tone (not the calibrator) on 40 but I wasn't able to recreate the tone.He might have been picking up a local birdie from some neighbor's home electronic gadgets. Lord knows all the things that are on the market that can cause RF problems.
> >
> > I do remember when I first got the rig back up there was a sudden jump in plate current (to 600 mA) on either 40 or 20 (I don't remember which) and I took that to be a neutralization issue. Since the rig had sat unused for many many years in a less than ideal storage (unheated garage or damp basement)I expected a LOT more issues with it than what I found.
> >
> > Cosmetically its a little on the rough side and the copper chassis is dirty topside and the case needs to be repainted. But if you look under the chassis it is a very clean radio with no signs of modification except for the fan mod I put in when I had the rig.He even has the DC mobile PS as well as the noise blanker (what I would do to have a blanker!!!) for the radio as it had been used as a mobile many years ago by another ham who sold him the radio.

14123. Hamfest stories that make you cry

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-03 21:28:19 UTC
From: Chris Farley
Topic: 14123 Message: 14123

We've all seen or heard about things that happen at hamfest that make us laugh, cringe, bawl, weep, or fall over on the floor in sheer pain. My personal topper happened this last Sunday at the Princeton, IL hamfest.

I drove the hour long trek with two fellow ham passengers in the old Chevy, and arrived at the fairgrounds about 7:30AM. We parked the car in a nice high traffic spot, as I had some junk to peddle out of my trunk. I made a quick round, found a nice big piece of Air-Dux in the box for $5, and emptied the contents of my trunk on the grass. I commenced to wander around in search of some more treasures I can't live without, by this time it was past 8 and the building with commercial vendors was open to the generous public. I wandered inside, and spotted a table with anchor-type schtuff. All right, some real radios! I promptly asked about the Henry 2K, Drake twins on the floor, and Hallicrafters S-20R also on the floor. I immediately bought the Halli for the asking price of $5, the gentleman to my left without skipping a beat interrupted and asked about the Tail Twister rotator and two control boxes sitting next to it, and promptly purchased for
the asking price of $25. The Drake twins had been sold, and we had a lengthy conversation about the Henry 2K, and my hesitation due to the "unobtanium" 8873 tubes it uses.

After reluctantly and graciously passing on the Henry, (he wasn't crazy on the price but it wasn't _quite_ a give-away..), I crouched down to pick up my bargain S-20R. Against my better judgement, I took a closer look at the Drakes. There was a TX-4B, R-4B, MS-4 speaker and AC-4 power supply. They were in quite remarkable condition aside from some dust, and the receiver was chock full of band crystals.

Against my better judgement, I said "Out of curiousity, may I ask what you got for the Drakes?"

"$30."

Yes.

Thirty flipping US Dollars. For the whole set.

I literally put my hand on the floor to keep from falling over, my jaw following suit.

That is the closest I have _ever_ been to being that jerkwad who says, "No, you didn't. Here- Here's $200, NOW they're sold." It took a lot of willpower to get back on my feet, and walk away with that measly little Halliscratchers after that..

A word of advise...
If you buy something at a hamfest for such a RIDICULOUS price you can't quite believe it yourself, do yourself and everybody else a favor. Pay the man, pick it up, and RUN. Do NOT leave it sitting there for an hour or more. You'll either make a bunch of people sick to their stomachs, or some so-and-so will find a way to buy it out from under you.

This one will be at the top of the list for many, many years I believe.

Regards,
Chris kc9ieq

If I am wrong, someone will correct me, I am sure. But, I do believe that this plug is typically a female RCA, used for the speaker, on a transceiver (TR3/TR4, etc). At least on an AC4, that's the way it is. The last person to work on that one, before you, likely had an abundance of RG-58, and just used it as shielded speaker cable.

Dale,

If that is the supply you got from me, I appologize I had intended to tell you about it. I traced that back and it is a connection to the VOX relay on TR-4's and TR-4C's. AC-3's don't have the VOX relay connection on the supply like the AC-4's do.

The VOX relay is a set of floating contacts that close when the xmtr is keyed. They are typically used to key an amplifier.

14128. TR7 - Loud cw note (birdie?) and computer clock noise.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-04 00:00:55 UTC
From: aa5wg
Topic: 14128 Message: 14128

Hi to the group,

Today, with the TR7 connected to a Drake 50 ohm dummy load, I noticed two new noises on 40 meters. These noises are still present when the antenna is connected.

There is a noticeable cw note on 7.0545 and 7.199 USB with Pass Band not turned on.

There is a loud kinda computer clock counter noise on 7.1785, 7.248 and 7.3085 with the Pass Band not turned on.

Any ideas how to fix these noises?

Thank you,

Chuck

figured out after printing the schematic of the ac-3. had nothing to do with anything normal, both the ac-3 and ac-4 showed no wiring to either of the 2 pins, maybe they started latter. / anyway clipped the wire and just finished changing the caps out , supply works like a champ.

Pins 5 and 8 are the Linear keying contacts that come from the T-4X(any)/ TR-4(any) relay. In the AC-4 they were wired to that silly little
two pin connector on the AC-4. There was no such connector on the AC-3, because it was designed for the TR-3 which had no capability to key
an external amp. The pigtail out the back of that connector was for the speaker output of the TR-3, the idea being a single connector to
pull or plug in when installing or removing the transceiver. Aside from the UHF antenna connector of course. Those of uswho got AC-3s with
our early T-4Xs and wanted to use linear amps, either rewired the 'RCA pigtail' out of the back of the transmitter end Jones connector, or
added another pigtail for that function.

I've never seen an AC-4 connector that did NOT have Pins 5 & 8 wired to the VOX connector. Both pins were isolated from ground by the way,
so that polarity was not important for the non-keyed two pin connector.

Again, the TR-3 was designed as a MOBILE SSB transceiver, so not likely to need to key an external amplifier!!

14136. Re: [DrakeRadio] power plug on late ac-3

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: William Houghton
Topic: 14124 Message: 14136

Garey,

Since I had this very supply before Dale, I can tell you that a previous owner added the RG-58 cable to pins 5 & 8 and installed a male RC plug on that cable. The male plug was probably to keep it from getting confused with the speaker cable. My guess is that a previous owner of this AC-3 wanted to key an amp with the TR-4 that he/she had.

73,

Bill

Subject: Re: [DrakeRadio] power plug on late ac-3

Pins 5 and 8 are the Linear keying contacts that come from the T-4X(any)/ TR-4(any) relay. In the AC-4 they were wired to that silly little

two pin connector on the AC-4. There was no such connector on the AC-3, because it was designed for the TR-3 which had no capability to key

an external amp. The pigtail out the back of that connector was for the speaker output of the TR-3, the idea being a single connector to

pull or plug in when installing or removing the transceiver. Aside from the UHF antenna connector of course. Those of uswho got AC-3s with

our early T-4Xs and wanted to use linear amps, either rewired the 'RCA pigtail' out of the back of the transmitter end Jones connector, or

added another pigtail for that function.

I've never seen an AC-4 connector that did NOT have Pins 5 & 8 wired to the VOX connector. Both pins were isolated from ground by the way,

so that polarity was not important for the non-keyed two pin connector.

Again, the TR-3 was designed as a MOBILE SSB transceiver, so not likely to need to key an external amplifier!!

The other side of that is a widow may have lost out.
When a friend on the other side of the state passed away some eight years ago his wife mentioned after the funeral that she was going to take his gear to a local ham-fest. I asked her to wait a while as my wife couldn't make it to the funeral and we would come back in a few weeks for a visit. While the girls were visiting I went to the garage where she said her daughter had staged his equipment. She had actually done a pretty good job of getting things in proper boxes. I got it all together and made an excel spread sheet indicating what accessory's went with what. (Some moduals for a transceiver hadn't been installed.) Then listed fair market values I thought she could get. It came to $6000. A local ham came by looked at the spread sheet and agreed and gave her $4000 on the spot. So he made a few bucks and she had no hassle. I hope someone does that for my wife.

Other than new product deals at the hamfests local to Indy, I have never found one reasonable deal on used gear. Amplifiers are always almost non existent and the used radios are always way over priced junk. I quit going years ago unless there's a new product I want to buy.

The hamfests around here have been generally picking back up, although some years are better than others. I've had sellers tell me on more than one occasion that they are fed up with eBay. Sure, there is overpriced stuff, and junk, and both. But there are also deals to be had. I came within centimeters of buying a nice NCL-2000 last year for a very reasonable price, but I already have three amplifiers. Sometimes I still wish I had bought it...

What saddens me is that so often some offspring on a mission barges in and orders all that junk of dad's removed---NOW---so we can sell the house and get the heck out of here back to OUR lives.
That is sad. I had offered to help a widow a few years back and working from a list had offered a pretty fair price for everything plus a comission on what I sold. It was done deal but missy daughter (miss organization) blew in from another state and beat down mom about needing to get that crap out of the house so as to not delay the listing process so they could move mom to the senior home where she belonged.
Because of a severe winter storm I couldn't drop everything to travel across the state to pick it up and it went for junk, but it was gone immediately. And I'll bet dollars to donuts missy ain't been back since to see mom in her new apartment where she stuck her---out of the way.
That's what raises my ire.
I know, I got three of them that won't be any different but I am not giving up what makes me happy so they will have an easy time when I am gone. Just ain't gonna happen.

I have been lucky. I have picked up things just by being in the right place at the right time. Saw an ad in our local ham clubs' newsletter, about a widow of an SK that needed help cleaning out her husband's shack. I found out several weeks later that no one had responded so I volunteered to go up and help out. I was the only one to show up. Took half a day..the guy was an 'old school' Extra..had a parts department in his shack, that when loaded into the back of my full sized pickup, filled half of it! He had at least 300 pounds of homebrew yagi's and verticals. Also had 2 SB-200's (Both pristine)and an unbuilt SB-220, both with beau-coup, NOS tubes, still in boxes. (The 3-500z's were still packed in sawdust!) He also had several unbuilt Cantena's as well as a partially built IM-28 VTVM (I finished it first thing..works great..even had an RF Probe that hadn't been assembled yet!), and a Heath scope with no label. I think it is an IO-17. He had 2 Kenwood TS-820(S)' [the models with the digi readout!], that looked as if they had just come off a dealer's display shelf, and in an unopened box, a brand new PalStar AT2K tuner. Long story short, After all was loaded, I asked her how she want me to handle selling everything, ie: best price, posted price, or what? She looked at me and said, "Oh no, I am **GIVING** this too you. I don't want any of it." I asked her if she was sure, and she said yes. She is quite wealthy..lives in a 4 million dollar house on North Shore, Lake Tahoe. So, Because I went and no one else felt like helping out an old wider lady...I cleaned up. Both 820(S)'s work fine..in fact, I used one when my TS-2000 took a lightning hit and had to go to Doctor Clif to get repaired. The SB-220 is in my closet..someday I will build it...One SB-200 I donated to Navy MARS here, the other is on, sorta a permanent loan, to a very good friend of mine who can't afford many 'toys'..

Heh...won't tell you how I acquired my 2nd L-4B...I think I told Garey at one time, but that's another story.

Yes, I have been very lucky over the years....Everyone tells me I should try my hand at gambling, as I live in Reno...no thank you....I like to get things for my money! LOL.

Chuck,

I just went and checked mine. I'm hearing one at 7.054-ish that sounds loud, but doesn't move the S-Meter. Also hear the noise at 7.1785, but not as loud as the other. Signals at the other frequencies are either non-existant or so weak as to be questionable whether it is really there or not.

If yours are stronger than that, there may be a couple of things you can check. Strange 7-line problems are often cured by simply re-seating all of the plug-in boards, or cleaning the contacts and then re-seating. You will want to make sure that the copper grounding fingers attached to some of the boards are clean and making good contact with the frame when the board is inserted. The screws securing the card cage cover should be *snug*, but do not over-tighten or they will strip. Check all grounding screws throughout the radio by slightly loosening them and snugging them back up.

In the end, there may not be a lot that can be done. Signals of this type tend to go with the territory of having digital conveniences in our radios.

I've done lots of organizing and selling for spouses of SK's. it means a lot to the families most of the time.

Best deal I've picked up at a fest was at Hosstraders about 15 years ago when I scored a pristine, working NC-300 for $15.

How I got back into Drakes was also due to a bargain - at the Shelby Hamfest in '07, IIRC. Bought a set of A Twins for $100 - including AC-4 and MS-4. Used them for a while before selling them to get B's. yeah, they needed work, but were not in bad shape.

Hi Jim,

Thank you for you information. These signals don't move my S-meter but can easily be heard. I will try your suggestions to help cure these noises.

Again, thank you.

Chuck

Subject: Re: [DrakeRadio] TR7 - Loud cw note (birdie?) and computer clock noise.

Chuck,

I just went and checked mine. I'm hearing one at 7.054-ish that sounds loud, but doesn't move the S-Meter. Also hear the noise at 7.1785, but not as loud as the other. Signals at the other frequencies are either non-existant or so weak as to be questionable whether it is really there or not.

If yours are stronger than that, there may be a couple of things you can check. Strange 7-line problems are often cured by simply re-seating all of the plug-in boards, or cleaning the contacts and then re-seating. You will want to make sure that the copper grounding fingers attached to some of the boards are clean and making good contact with the frame when the board is inserted. The screws securing the card cage cover should be *snug*, but do not over-tighten or they will strip. Check all grounding screws throughout the radio by slightly loosening them and snugging them back up.

In the end, there may not be a lot that can be done. Signals of this type tend to go with the territory of having digital conveniences in our radios.

Hi Guys,

I see that this ad is still up & running on The Ontario Swap Shop listings at http://www.kwarc.org/swapshop/searchfs.html

Not a bad source of parts for BOTH receiver & transmitter, in case you're interested (the Canadian market for such things just does not seem to be there):

Gaetan VE3AZQ [613-212-1365] in cornwall ON has listed the following (05-25-2013 07:46:54):

For Sale (last updated 05-25-2013, listed 04-04-2013)
Manufacturer: DRAKE
Model: R 4
Drake R4 receiver Parts.
Tubes set 30.00
Transfo 30.00
Meter 25.00
shipping extra
Many other parts avalaible.
For Sale (last updated 05-25-2013, listed 05-11-2013)
Manufacturer: DRAKE
Model: T-4X
Price: 75.00
Drake t-4X transmitter complete
Cosmetic a 7 on a 10 scale.
Was stored for 20 years so selling untested and as is.
Will probably need the paper capacitors to be replaces.

Shipping extra

The usual disclaimers apply, of course...

I was watching a YouTube video of an older Kenwood rig, and someone in the comments noted that there were price tags on the side of everything, and wanted to know how to buy it.

The poster of the video responded that they were not for sale, the prices were for whomever liquidated the equipment after his death, so that they would have an idea of the value of each piece.

I guess it could also work for your advantage, if you for example labeled a TS-830 as $1000 and a Ten Tec Orion as $100, a thief would grab the 830 and ignore the Orion. :-)

Geoff.

I emailed him and he will ship to the US. I decided against buying due to the shipping expense, but if I really needed one of these parts, it's a good source.

It's been more that ten years since I've been to one of the local swapmeets. I stopped going because it was mostly computer stuff and walkie-talkies for sale. This, despite the fact that there was a purely computer-oriented swapmeet that was held three out of four weeks at various venues in the LA area.

I didn't even venture into the fleamarket area at Dayton this year, mainly because it was my first time there and I wanted to concentrate on the commercial exhibits. That, and the usual periodic rain showers.

The problem with that approach is that the pricing can become outdated, depending on how long the tags have been on.

I will second what Ian said. While it is ALWAYS more about computers and trinkets, at the Chino Hills Electronics Swap Meet, most months there are several decent deals, on Ham, and commercial, radios, that can easily be converted to ham bands, to be had there.
Heck in the past year, or so, I sold a bunch of "excess to my needs" shack stuff there. Two and a half years ago, I bought my very nice L4-B there, with an N.O.S. set of 3-500ZG's, for $712. Don't ask how it was $712, it's a long story. But, it came from the estate of a ham, who had to go in a facility, as his Alzheimer's Disease had progressed to the point, of him no longer being self-functional. And, the money was to help pay his wife's expenses, for his care. Then there is the nice couple, who sells the connectors, power supplies and coax, they run a good business, and their products are what you would buy in the stores, but at reduced prices.
I've been buying and selling, there, since 2007. There have been some frustratingly "bad months" where you can't find a ham radio, in the bunch, but they are, contrary to the belief of many, fairly rare.

Actually his asking price was $750, and I wanted to pay that price, but went there broke, and had only sold $712 worth of stuff, by the time I was ready to leave, and the guy, who was selling right next to me, and knew I had interest in the L4-B, had been firm at $750. He asked how much I had, and I counted out the $712, and change, he said he'd take that. I hoped for taking home the $12, plus change, but he wasn't cutting any more of a break. Because I knew where the money was going, it wasn't difficult to go home, as broke as I went, since I had a very nice condition L4-B.

Jim,
I have never been to the one at Cable Airport, but I understand that they do have one, periodically, there, too.
And, there is the once a year swap meet, sponsored by the SoCal Antique Radio Society, at Fullerton Airport. For more info, call Scott Ford, at Ford Electronics in Buena Park, or check out:
http://www.antiqueradios.org/
Or:
http://events.pe.com/fullerton_ca/events/show/282976085-southern-california-antique-radio-society-swap-meet
Most of their stuff, is broadcast listening radios, but there are a goodly amount of hams who go there, too.

Cable Airport.....on Foothill, right...Claremont. That's where I learned to fly...well..got my 1st (of many) power rating, bought my first airplane there too...a 1952 Luscombe T8F 2 seater....I learned to fly..sailplanes, down at Paris, on the (then) edge of Lake Elsinore, when I was 14. The field got flooded, so the whole sailplane operation was moved up to Hemet.

Talk about a flood of memories.

Joe,
You know, it sure is nice to ruminate, and reminisce, openly, like this, without getting our wings clipped, like some other lists tend to do.
What a great, eclectic group of folks, that we have here, who all have something in common (Drakes, in particular, boatanchors, in general)!!!

In tough economic times, it is purported to be beneficial to invest in precious metals, like platinum, gold and silver.
Personally, I choose to invest in blued steel, brass, and copper jacketed lead.
As well as, classic old, vacuum tube ham radios.

And those of us who aren't old enough to reminisce, thoroughly enjoy hearing the stories too. Well, at least the weird ones like me!

I tend to think in fragments...

Were these tubes tested on a transconductance tube tester?

Garey,
No real progress with the TR-4, but I thought I'd let you know:
A friend came over with his tube tester and tested the tubes in my TR-4. There were five tubes that woren't on the chart in his tester
6ej7
6ea8
13de7
6gx6
and 6ev7
So those didn't get tested. The rest of the tubes were in the questionable range.

The most questionable one was the ob2. Under test, it displayed a purple glow and some visible and audable arching and measured 15 of 100 percent . So now I think I'm looking for someone with a newer (or older) tube tester.

It would sure be nice to have this thing off my bench. If I could get anything for it, I'd just sell it as is and let someone else worry about making it work. it's getting a bit frustrating.

Best test for 0A2 is to measure the voltage at the output, while in-circuit.

14164. 2-B muting fix

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-03 05:08:19 UTC
From: Ethan Blanton
Topic: 14164 Message: 14164

Hi all,

I recently acquired a Drake 2-B and it had a weak muting circuit --
after the radio warmed up, the standby switch wouldn't mute the radio.
I spent some time getting to know the bias supply and muting circuits,
and eventually fixed the problem. I have documented it here:

http://kb8ojh.net/projects/2-b-muting/

The TL;DR is that I refreshed the bias circuit (including checking
R48, the RECV SENS pot, which many have fingered as a likely culprit
in the past) and replaced the paper caps in that area, which didn't
fix the problem, and swapped a few tubes. Ultimately it turned out to
be V2, a 6U8 in the first mixer. Apparently it had enough leakage
from the grid to cathode once it warmed up to drag down the ~20 Meg
impedance bias supply.

I found a few emails from several years ago on this list tackling a
similar problem, and one gentleman mentioned that there's a likely
tube culprit, but he didn't remember which one. I don't know if this
was the same tube, but it did the trick for me.

Ethan

There are updates for some testers on the web, its
worth looking at BAMA and similar sources and doing a Google
search. Perhaps the widest range of tubes is tested by the
TV-7 series of military testers. The OB2 is supposed to
glow purple but its definitely not supposed to arc. This is
a 105 Volt gas regulator tube.

Congrats, you are the first! You win ... absolutely nothing! :D

That was taken last year at Field Day. This pic was sent to the newsletter crew along with some others (including the shot of the Yagi under the moon and the photo inset with it) as a jest, I really didn't think they would use it. That's not really the GOTA station, that's the 20 Meter Fone position at K0KKV, connected to the aforementioned Yagi. The op is me. If you zoom in on the pic, they actually kept the resolution pretty decent in the publication. The rig is my "daily driver" TR-7. Photos were taken with my Nikon D5100. IIRC, the TR-7 photo was snapped by K0NEB with my camera.

The TR-7 has been asked to come back again this year. I've been told that if I behave I can come with it....

OK I win nothing...but it was still fun!

Maybe we should come up with some more challenging pics to see how the masses do?

So was it a CW-75 or SP-75? – hard to tell from the tiny pic. I'll assume it was NOT a P-75!

I have a few Drake relics around here that might challenge our readers!

Oops, yeah, that's an SP-75. I wish I could FIND my P-75 now that I have figured out how to convert phone patches into computer sound card interfaces...

What you don't see is the Telex Echelon ANR 150 aircraft headset, with active noice cancellation. That's another fun toy. It's neat to watch people's eyes when they put the headset on and turn on the ANR and they suddenly can't hear the generator noise anymore!

14174. Re: [DrakeRadio] Spot the Drake!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-05 06:16:12 UTC
From: VE3AX/7
Topic: 14169 Message: 14174

Jim:

I had a chance to play with a set of Bose noise cancelling headsets at the Minneapolis airport when we got held up last January on the way back from Naples FL. Not sure now what model these were but they were ridiculously expensive - maybe $1,000?. Not the Quiet Comfort 3's or 15's which any Best Buy carries around $300-$400, but man they were unbelievable! Just the ticket for a shack full of 8877 VHF amps with too noisy blowers! Can't seem to find them on the Bose web site. Found my dream guitars in a display in the same airport – McPherson's – Wow! I'd have to sell my IC-7800.

OK, back to Drake – does anyone have any info on a 4-line style monitorscope? Lee Craner (on here) has done a gorgeous job on a 7-line style scope he made using a TR-7 chassis and a Heath SB-614. That's the only one I have ever seen other than the "Drake HO-10" I have here. I did not make it but did improve it, and will continue to do so. The puzzling part is the front panel, which appears to be done "at the factory". It's not the kind of painting just anyone could do. It looks just like the Drakes. It is a Heath HO-10 built into a Drake TC-2 cabinet. Would love to know if someone at the Drake factory had this thing made up. Already asked Bill years ago but he knew nothing about it. I found it in the back of a station wagon at Dayton moments before the fleamarket opened, maybe 8 years ago. Happened to come across a guy who offered me a fleamarket ticket at half price at 7 am that morning! Glad I bought it!

I thought of throwing a pic out there to see if anyone could "ID the Drake" but thought it a bit unfair!

On a slightly different topic, did anyone see the movie Madison with Jim Caviezel? The movie was based on Madison Indiana in the '70s and the Mrs. Madison race team. There was a Drake on board the old crew chief's fishing boat.

Speaking of spotting Drakes. About two weeks ago I was doing some work in the radio room and had the TV turned on. It was on TCM and they were showing the 60's movie "Our Man Flint" which was a bit of a spoof on the James Bond movies. I happened to we watching when there was a scene where a female radio officer was trying to contact the movie's hero. It looked like a Drake TR-3 on the desk, complete with a Vibroplex bug that she used to "send" the message.

Too easy – Drake TR-7 or TR-7A and CW-75 or SP-75 in the GOTA article.

14178. TR-3, LSB Problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-05 13:00:59 UTC
From: rjbart1@bellsouth.net
Topic: 14178 Message: 14178

I was visiting my mom in Ct last week and saw my senior TR-3 on the shelve in the basement, loved this radio. It developed a problem when ever I tried to go from USB to LSB frequencies. It was almost like that function suddenly stopped working. The radio would not load up, the receive signals were gone, worked OK on all of the USB bands. For the longest time I thought it was the crystal related to the LSB function. Instead of fixing it I just put it on the shelve. I am hoping to ship it to my current QTH, get it fixed, get a refurb PS, and use it with a good attic antenna. Anyone have any ideas on the repair?? Robert B, K1YFE

14180. r4c agc

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-05 14:21:07 UTC
From: yash@aol.com
Topic: 14180 Message: 14180

Been cleaning up a r4c that I just bought. I noticed the AGC problem. when in slow ,all seems ok, when in med or fast I get like a fast pumping ,in the audio with the s meter needle showing the same. signal get hard to understand. Just got the CD for the c-line . anybody point me in the right direction?
thanks
dale wt4t

Dale -

That's why you have SLOW AGC!. FAST and/or MED are if you _want_ to hear between code elements (QSK), or AM or some data modes.

Garey
I just never noticed this on the A or B line on ssb. I need to print the r4c manual today and do some reading ,answer some of my own questions. Also had the main knob off to see why their was no adjustment with the shirt to match the calibration tone. the rig had, once the main knob removed , then the skirt, then behind the shirt a gray plastic like bushing, seemed loose on the inter shaft and hard as a rock. what should it be , plyable? Is ther a detail on the cd for the assembly.

Another option is Sherwood's adjustable AGC kit. I have it on my R-4C and it allows for several different switched AGC settings that vary between very slow and fast pumping. I believe Sherwood's fastest setting is the stock "fast" R/C combination.

14185. r4c main tuning.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-05 21:33:16 UTC
From: yash@aol.com
Topic: 14185 Message: 14185

Went thru the whole cd on the c-line ,could find nothing, on my problem. Drake says to zero beat the calibrator then hold the main knob and turn the skirt till everything is in alignment. My r4c skirt won't turn the dial for the fine adjustment. I pulled the knob,the skirt and behind the shirt there is a gray plastic bushing that fits the outer shaft on the tuning assembly. that's all that is there. one end of the gray bushing push's up against the harp clip on the vfo shaft. and the other end must rub against the backside of the skirt? Is there some parts missing? should the bushing be tight on the vfo shaft? Is the bushing hard or like a piece if rubber. I can see it will be rather easy to fab something if necessary to make it work correctly. If there is a write up or picture of the assembly ,please let me know where.

thanks

Dale,

Garey is the best reference on this. I seem to recall that he once told me to sand the ends of that grey bushing. Yes, it is a hard material. I think I taped a short piece of sandpaper, maybe 100 grit (or was it 220 ?) to a piece of plexiglas and slid the bushing across the sandpaper. This will help to keep your sanding square. You just want to rough it up and remove the glaze as I recall. Again, Garey knows best.

73,

Bill

Hi Dale,

You will find that you need to push the knob against the Grey Tubing, before you tighten the screws,

If too tight, then you will find the adjustment will not work, If to loose, then the dial will slip.

You after a few attempts, you will soon get it right.

If the bushing has gone a little solid, then you may well have to rough up the ends as Gary says.

OK, so how do you know that it's an early PS-7? I would think it's a later version, as it has the printed circuit board for the rear panel switches, etc., instead of point-to-point wiring. See:

http://www.dl7maj.de/PS7-Inrush.pdf

Yeah, more of my pictures... :D

14193. FS: Unique Drake Service Supplement CDs

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-06 19:29:41 UTC
From: Garey Barrell
Topic: 993 Message: 14193

Here is the information that Drake left out of their manuals!

Unique supplemental service information CDs available for the Drake A, B and C Lines, 2-B, 2-C / 2-NT, TR-4, and TR-4C/Cw/CwRIT.

High resolution color photos of the under chassis and individual PC boards of each unit, with all parts identified and keyed to a parts list
make it easy to locate any component. No more trying to trace wires through bundles, etc. This information is not available elsewhere and
really makes a difference in servicing these units.

These CDs are NOT just scans of the original manuals that were included with the equipment when new. High resolution scans of the original
manuals ARE on the CDs, along with scans of manuals for associated equipment such as the C-4, FS-4, MN2000, L-4B, W-4, etc.

Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Milton,

power tubes are all beaten up but at least they should put 20W

That statement may be where the error lies. The tubes may be VERY dead. If so they won't draw any idling current or put out any power.

Marty

gentlemen, I have a non transmitting TR4, already checked all the tubes and replaced 2, power tubes are all beaten up but at least they should put 20W, power supply is just recapped and voltages are within specs, relays activate when needed and receiver is clear and loud in all bands, cleaned all contacts and controls, impossible to set .1 in bias according to the manual, but if measured directly from the pin 2 in either final, -62 variable bias voltage is encountered.
any idea where to start?

Exactly, one can hear the relay close but no matter the position of the bias control it wont move, I tested the tubes and compared their emission against a brand new RCA from a T4X and they are slightly lower than it, so there is my assumption that at least 20w are reasonable to expect but in my experience usually is a bit more.
I got this unit as is and it was full of dust, if someday it worked that might be 20 years ago.

OK ...

Check the voltage on the Cathodes of the PA tubes, both in standby and in TUNE. Make sure the SIDEBAND switch is in the '-X' position.

What is the serial number of the unit??

Hi Garey,

IOW, you were messing with me! :D

I'll have to check when I pull the system out for Field Day, I don't recall noticing where the Zener and resistor are.

Thanks for the comments on my photos, I appreciate that. My Nikon is always teaching me new tricks.

14201. Re: [DrakeRadio] my latest TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-07 07:24:49 UTC
From: William Houghton
Topic: 13832 Message: 14201

Garey,

What I was calling a cam is what you call a follower. I have since discovered that while the PTO holds calibration across the band bumping the chassis changes the freq. The amount of jump depends on the strength of the bump. Of course I found this by accidentally bumping the rig. I'm wondering if that disc in the back has too much wear. Bummer. I have checked ground connections, added the grounding strap for the follower, etc.

Now if I had a lathe I could make a new bushing for the coil end out of something like teflon.

Subject: Re: [DrakeRadio] my latest TR-4

Hi Bill -

Proud of you!! I'm not sure I follow the 'cam' you are referring to. The 'follower', which is the 'fork' threaded onto the lead screw, IS threaded, but it is a very loose fit. The spring from the top of the fork to the hole in the top corner of the shield can is what keeps tension on it. Drake later added a short piece of shield braidsoldered to the fork and to the side wall of the gearbox to ensure a solid ground for the lead screw/ferrite. Originally the ground was through the ball bearings and through the fork sliding along the guide bar at the top of the gearbox. This should NOT be lubricated.

Yes, the phenolic 'plug' at the rear of the slug is what keepsit stable within the coil. It should be a sliding fit, and the plug should be arranged so that it's in a diamond shape rather than a square. This minimizes the surface contact between the two pieces. Also not lubricated.

Always good to bring one back from the brink!!! Congratulations.

14202. TR-7 Loud Digital Clock Noise

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-07 11:31:52 UTC
From: aa5wg
Topic: 14202 Message: 14202

Can anyone duplicate this loud digital clock noise on your TR-7?

Setup:

TR-7 connected to 50 ohm dummy load
PBT = Off
Wide SSB filter selected = BW buttons out or not depressed position
AGC = Fast
RIT = off

Mode Switch Position:

1. AM = 5339.7 MHz = S6 digital clock noise
2. RTTY = 5342.1 MHz = S7 digital clock noise
3. CW = 5336.9 MHz = S2 digital clock noise and 5338.9 S2 digital clock noise (double hump)
4. LSB = 5341.1 = digital S6 clock noise
5. USB = 5336.3 = digital S5 clock noise

Thank you,

Chuck

Gotta keep you on your toes....! (Itmakes it much harder to chase someone...

I still have my Nikon F(Photomic), (50 years) and bought my Nikon 990 digital when they came out in 2000. Just think, a real 3.3 Mpixel
digital camera for only $1000, NO discounts. :-) But it's been worth every bit of it, and IS a Nikon. The thing that looked the screwiest,
(the rotating 'head',) has proved to be the neatest feature, especially as I get older and less (no, UNABLE) to get down on a knee for a low
angle shot. I can hold it down by my knees like a reflex camera if I want to, or way over my head, and still see the viewfinder. Genius!!
:-) Some day I'll work all the way through the 100+ page manual to learn more of the stuff it does!

So now you are able to set the idle current??

The S-Meter is likely a tube problem, possibly V17. Check Cathode resistor R92 for value, DC voltage on Cathode, and condition of C135.

Bill -

Is the spring from the follower to the shield can stretched out?It puts a fairly firm hold onthe follower and the slug. Are the brass rod
and rear bearing CLEAN and unlubed? Is the shield can locked with all four 'tangs' engaged? Yes, if you smack it, it will change a few 10's
of Hz, favorite trick is to raise the front feet off the desk an inch or two and dropit. It may change, but only slightly, not enoughto
make an SSB signal unintelligible. Remember, this was designed for MOBILE use, so can't be too touchy.

Thats correct, now I have idle in both positions of the sideband switch and have an output of 100W in 40 mts but noted that the Smeter even with the control all the way turned wont zero, and also it reads backwards when receiving.

14213. Re: [DrakeRadio] my latest TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-07 18:42:18 UTC
From: William Houghton
Topic: 13832 Message: 14213

Hi Garey,

Yes, the spring is attached from the follower to the cam if that is what you mean. I did not clean the "bearing" end of the brass rod but it didn't look dirty. I did reglue the phenolic disc back into the coil. The can shield doesn't lock as firmly as the can on the PTO in my TR-3. On the TR-4, I can wiggle the can slightly with the largest gap between the can and the back of the gearbox being maybe 1/2 mm. That seems to cause a slight shift.

Tapping the chassis lightly with the plastic handle of a Craftsman screwdriver will produce a few 100Hz shift. A firm tap (but not real hard) will cause of shift of about 5 to 10kHz. The FSK pin connected to a freq counter via a 10X scope probe confirms that the PTO freq is shifting.

I have the allen head set screw adjusted just enough to eliminate the wobble in the tuning shaft and play in the dial disc. I was cautious about overtightening.

thanks,

Bill

Bill -

Is the spring from the follower to the shield can stretched out?It puts a fairly firm hold onthe follower and the slug. Are the brass rod

and rear bearing CLEAN and unlubed? Is the shield can locked with all four 'tangs' engaged? Yes, if you smack it, it will change a few 10's

of Hz, favorite trick is to raise the front feet off the desk an inch or two and dropit. It may change, but only slightly, not enoughto

make an SSB signal unintelligible. Remember, this was designed for MOBILE use, so can't be too touchy.

From: Garey Barrell
Topic: 13832 Message: 14214

Bill -

OK, that is definitely too much shift for that mild a shock. The PTOis VERY sensitive to the shield can movement. You have to push in on
the springs on each side to get the tang to grab the inside wall of the gearbox. If you are at all uncertain, I'd remove the shield can, and
check the firmness of the mounting screws that go through the phenolic base into the back of the gearbox. Make sure the spacers are in
there. Also look around for any 'flying' components, making sure their connections are solid, without changing their position any more than
necessary. Resolderthe tap on the coil at both ends, there is enough stress on those connections to crack. Do a visual check of all solder
on the board.

You have the correct adjustment on the rear loading screw, just enough to take out any lateral play in the MAIN TUNING knob.

There should be enough spring load to prevent the follower from moving at all,a good 4-5 ounces.

Garey,

I did all you suggested and that seems to do the trick. Your are right, you have to press in on the springs to get it to grab. It now seems to be on there with no gap if I try to wiggle the can. Man, that is sensitive to the can position. The 2 inch tests cause a shift but not nearly as much as before, perhaps a littlem ore than some others but it is livable now.

Thanks & 73,

Bill

From: KA5DWI
Topic: 13670 Message: 14216

Hi Garey,

Thank you for the advice. I appears that was the problem.
I found the 6HS6 and 12BY7 at HAM-COM today. They were fairly inexpensive compared to retail.

Plugged them in and after an hour warming up, NO carrier.

Now I can play with the Boat-anchor on CW this weekend for the SKCC Weekend Sprint-a-thon.

14217. AC3 Rebuild

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-08 02:07:48 UTC
From: Don Cunningham
Topic: 14217 Message: 14217

I don't often offer recommendations for products offered to us, but I do when they are well designed and exceptional. I have no products to sell, and no interest in the efforts I recommend. All other standard disclaimers apply, hi.

That said, in an email "QSO" with Paul Kraemer, K0UYA, about his new boards for the AC4 power supply that I had bought to upgrade a couple of my supplies, I happened to mention that I had an absolutely mint AC3 power supply that I should rebuild. I had just hesitated to even touch the supply since it was so pristine. On a whim, I sent a picture of the supply to Paul, since I know he appreciates old gear and would like to see it.

He returned in an email an "offer I couldn't refuse". He said he would do the install of his new AC3 power supply board and perforated cover on my supply if he could take pictures of it for "before and after" shots for his website he is building. I previously had offered the AC3 and its companion R4 and T4X for sale, thinking that all of it was pristine and some "collector" should have it if they wanted one like that. NO one responded at all, save one, and he has apparently disappeared.

I decided that since no one apparently wanted a pristine set, and I am a user of the gear NOT a collector, I would take Paul up on his kind offer and just let him have this supply for his pictures. Besides, I wouldn't have to install the board/cover and I would get a nice user supply for my TR4C. We made a deal that we both could live with, and off the supply went to him in Iowa. Well, I got the supply back yesterday, and all I can say is "WOW!!!". The board is immaculate, well designed and is now the supply is totally safe. I have seen AC3's over the years, "cobbled up" in all fashions, most now death traps, but this supply is now good for another 50 years of service.

I should have known I would be impressed, as Paul's AC4 boards FAR exceeded my expectations, even though I have procrastinated and not yet installed either that I bought. The AC3 works VERY well, has a nice perforated cover over the board to make it safe (since the AC3 has no top cover). This will probably be a cooler supply than the AC4 since it doesn't have the top cover to hold the heat in. I know I won't miss the "THUMP" when it comes on anymore, hi.

I very highly recommend Paul's work and the AC3 and AC4 boards to you. I hesitate to call them "kits", as they are professionally built and fully tested before you get them!! All you have to do is gut most of the old supply and install the new boards as directed with nice, clear instructions. They have already been "field tested" by many and all the bugs in documentation have been discovered. If you have been procrastinating in getting with him, don't do it any longer. I won't speak for him, but feel

sure if you have been wanting to do your supplies and haven't had the time or inclination, he would talk to you about doing the job for you. Contact Paul at elespe@... if you have pricing or other questions. You'll not be sorry, and you WILL end up with a nice supply for your Drakes.

Thanks, Paul!!
73,
Don, WB5HAK

It looks like you may have already solve your problem, but wanted to add one thing I did when bringing back a TR-4 I obtained; which had been sitting for quite a while. (All of this is in the archives.)

After doing all the usual cleanup, getting rid of dust and other substances and using contact cleaner on the usual cast of characters, I was still seeing some really strange voltages when comparing to the voltage chart.

What I did to correct this problem was also clean all the vacuum tube pins as well as the tube sockets. After doing that a couple of times, the voltages were much more in line and thing really started to work a great deal better. BTW, I was using DeoxIt.

For what it is worth.

Thanks for the advice, what I do is put some car polish in the pins and pull in and out several times to polish the contact area in very dirty contacts, what I have found is that it is only transmitting in 40 mts, nothing on 80, 20, 15 or 10 but I found out that giving a little hit to the chassis with the handle of a screwdriver it starts working, so something is not making good contact, now the hard part is to find which is..

Jim, Garey and all,

I guess the next step to reduce S6 digital clock noise to S0 is to take all the boards out and clean the contacts with Deoxit.

What do you think?

That's a good start. While you're at it, make sure all the copper spring ground tabs are bent up to where they are making contact. Also,
be sure all the screws are in the cover plate over the card cage.

Chuck -

I don't believe this is DC-DC converter noise, but while you're mucking around in there be sure the shorted turn of insulated wire is firmly
inplace around the small transformer on the Power Supply card. Contrary to what some have said, it's not there to hold the transformer
together!! Aside from being wrapped the wrong way for that!!

Garey,

I have always wondered about that card cage. What are your thoughts about adding star washers under the screws holding the cage cover down?? I have a couple of them that have gotten "wallowed out" (fine technical term, huh??) over the years and that makes it hard to keep contact. I have been lucky in "hammering out" from the back side some of them, but that even doesn't work after a few times. We do have to get in there often to clean the contacts, so this will get even worse.

Just thought someone may have discovered something that works really well. The thought just occurred to me the other day while in the "new" orphan I just got that thin star washers just might be a solution.

73,
Don, WB5HAK

My previus comments on this topic in message #14143:

Strange 7-line problems are often cured by simply re-seating all of the plug-in boards, or cleaning the contacts and then re-seating. You will want to make sure that the copper grounding fingers attached to some of the boards are clean and making good contact with the frame when the board is inserted. The screws securing the card cage cover should be *snug*, but do not over-tighten or they will strip. Check all grounding screws throughout the radio by slightly loosening them and snugging them back up.

OK, I'm not Garey, but I don't think I would use star washers. They could chew up the aluminum over time, compounding the problem. I've used flat washers under the screw heads, but the downside of that is that you have to remove the screws completely to take the cover off. If the cover deteriorates too much, I'll probably go back to the flat washers.

Or maybe someone with the resources will start making repro card cage covers...

Thanks, Jim. I really meant "Garey and all", I just had a one track mind for some reason. If you hadn't chimed in, I would have asked directly, hi. Thanks for the comment, I can see what you are saying and hadn't thought through that. The ones I meant were the "inside star" washers with a lesser impact, but I will try just a few flat washers where they just have to be used (head now goes all the way through the hole). Not many of those, and I do have a parts donor or two left. Garey just triggered a memory.

73,
Don, WB5HAK

14229. Let Smoke Out

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-09 03:45:29 UTC
From: rdl014
Topic: 14229 Message: 14229

I recently bought a nice Drake R-4B receiver and thought that I would re-tube the radio as it did seem to be a little weaker and noisier that I thought it should be. I assembled the required new tubes and proceeded to swap out the tubes and did a double check to make sure that the right tube went in the proper socket.

After re-tubing, I thought I might as well adjust the notch filter as it did not seem to be doing a very good job. I had the covers off the radio and had it setting on my work desk.

I turned the radio on with an external speaker connected, no antenna and the mute plug in. I was pleasantly surprised to find that the noise level from the radio was extremely low, much lower than it had been before re-tubing.

As I checked to make sure all the switches were in the proper place to adjust the notch filter, I heard a loud "pop" and saw smoke coming from under the chassis, right rear beneath the area of the transformer. All lights and tubes remained on, sound stopped, but I did hurriedly turn off the receiver and unplug it.

Under the chassis, I found the blown out shell of a 10 microfarad electrolytic capacitor lying on the desk. Strangely though, I do not see where it was located.

Any suggestions as to where this capacitor may have been attached and if just re-tubing could have thrown enough extra stress on the capacitor to cause it to blow.

Thanks and 73, Ray AK4RL

It has been a while, since I tinkered inside of my R4B, and I can't tell you, where it goes. But, I STRONGLY suggest getting Garey, K4OAH's CD, for servicing the "B" Line. It has WONDERFUL, high resolution photos, that will likely tell you, where to find the connection points. In this day, and age, it is a necessity, for keeping any set of Drake Twins, or a Tr-3/4, up and running well. Trust me, I believe that it is the best $25 (I think that's the price) you will spend, on your Drake. An invaluable tool, to say the least.

Ray -

You just had lesson one in why it's never a good idea to replace ALL tubes at once!!
'Re-tubing' is fine for spark plugs, but not radios.
Every tube you put in there is over 30 years old, perhaps older. Maybe good, maybe not.
Tube testers don't always tell the truth. Now you
know why the 'noise level' was so low....! :-)

Anyway, lecture over. What does this cap look like, size, color? Most 10 uF caps in the
R-4B are little teardrop tantalums, and they don't
leave a 'shell' when they go, more like dust!. Perhaps C91, the BIAS supply cap? It's
originally 8 uF @150V, but......

Dan, that sounds like the bias supply cap - though they were 8 uf from the factory. When replacing, remember that the positive side is grounded. While you're digging around the power supply area, make sure those high-wattage dropping resistors are in good shape and replace them if they look suspect.

From: Charles Ring
Topic: 14229 Message: 14234

This happened to my R-4B long ago. I was in the next room and it sounded as if something heavy had fallen on the wood floor. My notes on the schematic say it was C91, 8 uF at 150V. The blown cap was in tiny pieces that took a while to pick out with long nose pliers. As Steve Wedge said, the positive side of the cap goes to ground. Probably unrelated to the tubes or the notch filter.

14235. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-09 19:23:21 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 14235

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

Under better lighting (daylight), I now see that the capacitor that blew was connected between pin 1 of V-7 (6EH5) audio output tube and a ground lug on the chassis. My schematic does not show the values of the parts though.

I know it is 10 microfarads from the blown case but what is the voltage rating of this capacitor?

Thanks and 73, Ray AK4RL

Hi Ray,
That's the cathode of the 6EH5, the cap is an audio bypass. A 25 volt rating will be sufficient, pos. to tube, neg. to gnd. Not critical for general operation, but will make the audio sound crappy (technical term there).
I'll 2nd the suggestion to get Garey's CD if you plan to use/maintain this unit.

Still, Garey is correct. It's never a good plan to replace all the tubes just because you can.

14239. Narrow filter insertion loss

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-09 21:58:12 UTC
From: Steve Wedge
Topic: 14239 Message: 14239

Does anyone have access to rough figures of what the insertion losses are of the C-Line 1.5, 0.5 and 0.25 crystal filters compared with the 2.4 filter? Just curious, as I notice the level of the calibrator does drop off as you go narrower.

It's a little tight in there but quite doable with a Weller station with a normal conical tip.

And yes, the negative goes to the chassis on that one.

You might want to consider re-capping the whole rig unless the failure was due to an overvoltage situation.

14241. Peaking the RF trimmers and those 10k resistors

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-09 22:05:28 UTC
From: Steve Wedge
Topic: 14241 Message: 14241

I think I heard once that the reason for putting the 10k resistors on S1D and S1E was to make them less sensitive during alignment (lower the Q, perhaps?). I just tried doing this with an R-4C instead of my usual peaking on the correct frequency with no loads attached, and I couldn't get the two rear trimmers to peak at all. After removing the loads the sensitivity was horrendous. Needless to say, I reverted back to peaking the trimmers with no loads and the rig is back to normal.

Why did they want you to use these loads?

>
> Thanks and 73, Ray AK4RL

On my schematic it is shown as C-176 10uF 25V. It is the cathode bypass cap for the audio. The designation and information for the cap is off-set a bit so it looks like there is nothing there but a plus sign. Maybe its left off some versions of the schematic.
The tube socket voltage chart shows pin one to have 4.5 volts on it. I guess even low voltage caps can explode. But this is odd because the cap is not subject to high voltage. Are you sure this is the cap that blew up? If it is check further to see what caused it. If this tube was replaced check to see that the right type of tube was used and that the new tube does not have some sort of strange short. If you don't have a tube tester an ohm meter should show something like this.

Having struggled with some problems in an R4XB I think
the only caps that should be replaced are the electrolytic
ones. Most of the others seem to be either plastic film or
ceramic caps. These are usually very reliable and long
lived. The construction of the Drake B series is so tight
that I think its best leave alone anything that is not
definitely broken.

From: John Sehring
Topic: 14245 Message: 14245

Oh, I'm so sad to read of such butchery!

There is not an infinite supply of Boat Anchor equipment left. No need to trash what remains.

The death toll is two Heath monitor scopes (HO-10 & SB-614), one TR-7 (where did the chassis come from? The rest of the radio?), and one Drake TC-2.

(I own a pair of Heath SB-620's, HO-10, and a pair of SB-620's. All nicely working, all in original shape, thank you kindly.)

Gone, gone, gone, never to be seen again.

And what's left? Zombie hybrid junk that has basically no value. In so many words, it's just crap. Non-reversible, unrestorable.

For Gawd's sake, what's this mania? I could shoe-horn a Chevvy engine into a Ford chassis. Call it what, a "Fordolette"? To what end? The point?

Rant mode = "off".

--John Sehring VE6EQR-WB0EQ nr Calgary, Alberta, Canada

>>>OK, back to Drake – does anyone have any info on a 4-line style monitorscope? Lee Craner (on here) has done a gorgeous job on a 7-line style scope he made using a TR-7 chassis and a Heath SB–614. That’s the only one I have ever seen other than the “Drake HO-10” I have here. I did not make it but did improve it, and will continue to do so. The puzzling part is the front panel, which appears to be done “at the factory”. It’s not the kind of painting just anyone could do. It looks just like the Drakes. It is a Heath HO-10 built into a Drake TC-2 cabinet. Would love to know if someone at the Drake factory had this thing made up. Already asked Bill years ago but he knew nothing about it. I found it in the back of a station wagon at Dayton moments before the fleamarket opened, maybe 8 years ago. Happened to come across a guy who offered me a fleamarket ticket at half price at 7 am that morning! Glad I bought it!

Usually when people "make" equipment like that, the parts were from units in very poor condition or already parts radios. If someone took a perfectly good working TR-7 and made it into a scope, different story- But finding someone who would actually commit such a heinous crime would be far and few between.

Don't get your bloomers in a wad

That one is an electrolytic, Richard. It's included in the re-cap kit from Hayseed.

I'm suspecting with older radios that some will have caps that dry-out faster than others. I still find quite a few receivers with perfectly good electrolytics in them. I just sold an R-4 that was all original and there was no hum or other evidence of bad caps anywhere, and I've worked on R-4C's that have loads of hum / caps that have gone EOL. Could be if they're stored in an attic they dry out faster, or, who knows? Even use will affect that, I suppose.

Ray -

I see you have identified the blown cap. Check the value and condition of the resistor R44. If OK, when you replace the cap, immediately
check the voltage on Pin 1 of V7. Itshould be very close to 4.5 VDC. If not, you may have a bad 6EH5. Other possibilities are a leaky C87
or C185.

By the way, the identity of C176 is shown just above R95. Just a Drake schematic quirk! :-)

Thanks everyone for your great help. I think I may actually have an electrolytic 10 uf capacitor here of the proper voltage.

I have as of today ordered the CD as recommended.

One other question, should I put the old tubes back in and then replace them one at a time about a day apart or how should I have gone about replacing the tubes.

Thanks and 73, Ray AK4RL

I've bought a lot of things on Ebay over the years but am dramatically slowing down. The prices there are crazy and many tines unrealistic. In most cases I can buy the same product from fresh stock from an authorized dealer for less money then what Ebay brings in for the goods. (I'm talking about things that can be bought new today in stores). For example, I bought this week a new HP 8600e printer for less money then what they are sold for on Ebay. I bought some 6DE7 tubes from a tube dealer this week for considerably less money then they go for on Ebay and I could buy as many as I wanted to lower the shipping costs per tube. Almost any new product I buy on line from other sources is cheaper then found on Ebay. So it's been my experience Ebay is OK for one of a kind items but for anything else, you can always beat Ebay prices. (Other examples are transformers, capacitors, and resistors. I usually can buy this stuff cheaper at Mouser then from Ebay).

Can't believe it either
Need to find some of those hamfests others are always talking about---you know---where the seller practically paid the buyer to haul away that gear.
Urban legend perhaps, or many years ago.

That one and the filter caps are electrolytics but most of the others are not. I am still puzzled about why this cap would explode like that. If it was close to being shorted it might draw enough current through the tube to heat badly and that is probably what happened. Not good for the tube either or the output transformer.
One of the failure modes of electrolytics is that the dielectric film shrinks in thickness so the cap begins to have poor insulation.

Garey suggested checking the other components around
the output tube which I think is an excellent idea. The
blown cap may have caused damage or was itself caused by
something else although it might just be age.
I would restore all the original tubes. Check the
performance. If the sensitivity is low go though the
alignment procedure and see if that improves it. If its
still weak or has some other problem change one tube and see
if it makes a difference. If not put the old one back and
change another. You may have ONE weak tube and the others
good. Old tubes are somewhat of a problem. If unused they
don't change much but you usually do not know the provenance
or history. Unlike some others I am a believer in tube
testers. I think they can save a lot of grief. Even though a
tube may test marginal and still work well and one sometimes
finds tubes that test OK and don't work, most of the time
tubes that test bad _are_ bad. A good tester can find
shorted or gassy tubes or tubes with open filaments or other
major problems. They are also useful for comparing tubes.
While an emission tester is limited in its testing it can
still find tubes which are very weak even though they look
OK.
Our routine at Hewlett-Packard at the factory service
department was to routinely test all the tubes in incoming
equipment first. Much of what we got was used very heavily
and often many of the tubes were on their last legs. The

tester saved a lot of time.

I think it has a lot to do with the "I want it, and I want it NOW!" mentality. Unless it is an exceedingly rare item, odds are you *will* find that item again for cheaper, down the road. IF you want to wait. Good example, the rare Drake MC-4 mobile console installed under the TR-4 in my old Impala. FINALLY found one for sale a couple years ago. The price seemed pretty high for what it is, but they are very hard to find, and he had one for sale. And I wanted it. I see another one went for something like $40 on eBay last month <facepalm>.
So YES I could have had one for much cheaper, but I wanted it, and at the time has the money to have fun with.
Not so much the case now, but I digress..

Richard Knoppow, you brought up tube testers. What does one do if specific tubes are not on the roll chart of a tester?

14258. Now, I'm scratching my head

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-10 11:25:26 UTC
From: Steve Wedge
Topic: 14258 Message: 14258

Morning, everyone!

Yes, I sell on eBay, and darn near anything can happen. I have to wonder about the legitimacy of this winning bid

http://www.ebay.com/itm/Nice-R-L-Drake-AC-4-AC-Power-Supply-TR-4-T-4-also-for-Collins-and-other-radios-/111082017650?ssPageName=ADME%3AB%3AEOIBUAA%3AUS%3A3160&nma=true&si=1gtTltAewapRPScj%252FujtM5pniB8%253D&orig_cvip=true&rt=nc&_trksid=p2047675.l2557

This is NOT the rare late model with the 120/240 switch, either. Just a plain-Jane AC-4!

I do wish that mine had gone for this much :-/

From: Steve Wedge
Topic: 14242 Message: 14259

Yep.

I have a decent (but deaf) R-4C that I snagged off eBay about a month ago for $250. Bargains are out there, but you have to be patient, stick in one bid and stay with it. If you don't get this one, you may get the next one.

There are still lots of ways of making money there, but eBay has really been getting greedy. Between PayPal and eBay fees (plus now also charging on the shipping) it's nearly 15%. I just put my Buy It Now price at retail + 15% and the problem's solved.

14260. Re: [DrakeRadio] Re: Let Smoke Out

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-10 15:02:25 UTC
From: Garey Barrell
Topic: 14229 Message: 14260

Richard -

You start out with the right attitude, but then you fall back into the 'tube tester weeds'! :-)

A properly operating radio, with a 'set' of new tubes, (a 'set' being equal to one of each TYPE,) and a little time. Replace each tube with
a 'new' one, and note if the radio works the same, better, worse, or notat all. If either of the two latter results, try another 'new'
tube'. When you find a new one thatworks 'better', leave it in there and put the old one aside. When you find one that works the same, put
the old one back in and put the 'new' one in a box marked 'tested spare'. Move on to the next tube. Repeat for each tube untilall have
been tested, and you have at least ONE 'tested spare' of each type in the box. Put the box on the shelf, and do a complete alignment of the
radio.

Now, when you have a failure of the radio, troubleshoot to find the likely faulty stage(s), and replace those tubes one at a time with your
'tested spare'. If one 'fixes' the problem, you're back in business. Plus you had the spare on hand! If not, get out the VTVM and find
the REAL problem!

My first job was at an FBO, pulling aircraft radio equipment, testing all the tubes on a REAL tube tester. Testing included Gas, Short
(while tapping), and 'life' (reducing the filament voltage by one step and noting transconductance. If it dropped more than two divisions,
replace). The KEY here is that I did a dozen or more a DAY. A lot of KING and COLLINS and some others, but a BUNCH of different radios.
The KEY words are BUNCH and DAY, plus LOT. We had a storeroom FULL of tubes, and sold a LOT. A tube tester was the only way.

However, for ONE ham, with one or even two 'stations', a set of known good spares is far more efficient. MANY of today's vintage radios used
a lot of the same tubes (especially the Mosley receiver that only used five of the SAME tube), and if you're smart and stick with Drake you
don't need a LOT of tested sparetypes!! :-)

I have a TV-10 D/U. It works great but I haven't used it in over a year. Swapping is much faster.

Besides, the tester probably wouldn't have found that noisy 12BE6 I had a few months ago.

I do keep it on hand and have been thinking of making an adaptor for the 6JB6's. That would definitely be faster than having to go into the cages on the early T-4X's, where you have to remove the whole cage just to change the tubes...

14263. What NOT to sub for a 6EJ7

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-10 20:59:26 UTC
From: Steve Wedge
Topic: 14263 Message: 14263

Going through my other R-4C - the one that's deaf as a haddock.

Started swapping tubes and got to V2 (first mixer), pulled it out and noticed it looked a bit "odd".

Someone had thought they could replace a 6EJ7 with a 6EH7. When I put a 6EJ7 in V2, the receiver came alive! The S Meter is still pretty Scotch, but at least I'm on my way with this one!

BTW, the previous owner installed a couple of those entirely-too-blue LED lamps. If anyone thinks these are way too cool and wants them, I'll send them to ya for a Drake tube of your choice

Started swapping tubes and got to V2 (first mixer), pulled it out and noticed it looked a bit "odd".

Someone had thought they could replace a 6EJ7 with a 6EH7. When I put a 6EJ7 in V2, the receiver came alive! The S Meter is still pretty Scotch, but at least I'm on my way with this one!

BTW, the previous owner installed a couple of those entirely-too-blue LED lamps. If anyone thinks these are way too cool and wants them, I'll send them to ya for a Drake tube of your choice

That would be of limited usefulness, as a tube tester would not test the JBs at RF. They can check just fine, even "strong" on a tester, and yet have serious falloff on 15 and 10 Meters.

Steve -

If you have a TV-7 or similar, Dan Nelson (recognized guru of TV-7 worldwide) offered a set of two adapters and a list of test setup and
quality data for about 100 different 9 and 12 pin Compactron tubes.

I bought a set about 15 years ago, and the last time I looked he was still selling them for about $20. Well worth the cost, and covers
most any Compactron you're likely to want to test.

The adapters are quite rugged and well made.

An email to Dan <djn@...> should get you the information. Please report back with what you find.!

Just noticed on my 2B when I turn the passband knob nothing happens the passband coils no longer move in or out the mechanism seems to be slipping some where inside the passband unit. So to see what's going on inside I need to remove the passband unit from the radio. How do I remove the filter selector arm attached to the outside shaft of the passband unit? It appears solder to the outside brass shaft which also has a "C" clip up next to the filter switch does this clip come off to allow the filter switch shaft to slide through the front panel for removal?

Last week, when I posed the question about crystal reliability, there were several amongst us who mentioned the 18.1's (40m) seeming to go bad more than the others. I just got another one in this R-4C I'm working on. This one was still working but was off-frequency by 10 kHz.

I was lucky that I had a spare one.

Dave,

If the PBT in the 2B works like those in the A- and B-Twins, it means it's time to disassemble it, clean all the congealed old grease off it and re-grease.

I think it may be YOU!! :-) I can't think of anything that would make the 40M crystal more subject to failure than the others.

1. 40M is used more than the others and the crystals just 'wear out'.?

2. 18 MHz is where crystal type switches over from fundamental to overtone operation?

3. Resonance in the circuit that overdrives an 18 MHz crystal?

4. Resonance in the HC-6/U holder construction that damages the crystal?

Strangely enough, the 40M (11.0 MHz) is the most common failure crystal in the 2-A/B, so perhaps the 40M answer is the best!!

Jim -

I don't think anyone has ever explained just 'why' tube fall off in gain at high frequencies first. I've made a rudimentary search through
my books, including the 'Radiotron Designer's Handbook', and can't find any reference to it.

Assuming the first electrons that come off of the Cathode coating are the same as the last ones, the only thing that comes to mind is the
sheer number of electrons. I don't know enough about vacuum tubes to know if there is a gradual reduction in the volume of electrons, or if
they run at some level to near the end and then just run outfairly quickly.

I'm not sure WHY a 'partial' or 'reduced' stream of electrons would cause reduced gain _at high frequencies_ first??

If all this is true, HOW can a tube test 'strong' (a measure of emission?) and still have reduced gain at high frequencies?

Stupid tubes..... :-)

I'm at work, just got off the phone discussing some skin depth/hall effect research. Maybe tubes can develop a skin depth issue, that manifests itself at higher frequencies initially. Either a previously conductive coating is thinner, OR a deposit of a less effective conductor is occurring.

If you have determined that the knob is NOT slipping, you will have to remove and open the Passband Tuner. The slugs are pushed out by a
cam system, and are returned by spring loading. The grease Drake used appears to be wheel bearing grease, same as used on PTO bearings, and
dries out.

Steve just recently re-did one for I think an R-4B. He would be the 'freshest' source of procedure. They ARE all the same, from the 1-A to
the R-4B, just progressively more bandwidths in later units.

Date: 2013-06-11 16:57:52 UTC
From: Paul Pollock
Topic: 14229 Message: 14276

Hi Gary,

Thought I'd pipe in. Since wavelength is a measure of frequency, it seems pretty easy to make a good guess that the physical relationship of the Anode and cathode would have a lot to say as to how efficient a given tube is at a specific frequency. It also explains why the tube makers tended towards smaller is better, where a specific tube had to work into higher and higher frequency; limited by the specifics of that particular tube design.

For example, we don't find a lot of big tubes working into the VHF spectrum (I know there are several that come to mind [4cx250, etc], but look at the internal design of those tubes and then compare their design to simpler shortwave tubes). Component distance plays a strong role in whether a tube will work at high frequencies versus low frequencies.

Basic physics works. Distance of components counts. This why transistors do better (even early on in the design history) at higher shortwaves than simple tubes (versus the compacted one <grin>). I'm not saying transistors are efficient, they're not; but because they don't have the physical size of tube parts, they aren't limited as much in frequency. Most nuvistors do a great job into the high shortwaves and VHF. Again, obviously, size and distance of components in a specific tube design is a major design consideration. Then we get into the really exotic stuff, klystrons and magnetrons,and when we look at these designs with modern eyesight, we begin to see that designers were bumping into "quantum mechanical designs", before they even had the term.

Just my 1.5 cents worth of nonsense. Have fun and good luck!

Topic: 14229 Message: 14277

Paul -

OK. Well as Iproved with my earlier post, I am far from expert. Your explanation makes sense froma frequency limitation due to internal
lead inductances (length) and physical sizes. Look at the acorn style tubes.! Element size and spacing is also and understandable factor
from aphysics standpoint.

WhatI'm questioning is why the (gain?) changes as the tube ages? This is most easily observed in the 6JB6 tubes used in the Drake
transmitters. They work fine when new, but as they age, the power output begins to drop, starting at 10M, working its way down to 15M and
eventually even to 20M. Some brands drop in gain fairly early in use, GE in particular comes to mind. They drop about 10W on the upper
bands very quickly, but then seem to drop at about the same rate as the RCA tubes do. So something changes pretty early in their useful
life, and it's fairly constant (just a few hours for ALL bands to drop about 10W) and then go into the 10 , 15, then 20 pattern.

I guess this is just part of the price we pay for using a tube designed to run at about 16 kHz and push it to 30 MHz! (55 MHz in the TR-6
and TC-6.)

Information!!!

Compactron Adapters - Set of (2) adapters which allow
single section 9 pin and 12 pin compactron sweep tubes to be tested
on TV-7 type tube testers. This lets popular tubes such as 6JB6
6JE6 6JF6 6JM6 6JS6 6JU6 6JZ6 6KD6 6KM6 6KN6 6LB6 6LF6 6LQ6 6LR6
6LX6 6ME6 6MJ6 12BJ6 20LF6 21JS6 23JS6 24JE6 27LF6 30KD6 40KD6 8950
7868 be tested on TV-7 testers which do not have compactron
sockets. The adapters are NOT suitable for multi-section
Compactrons, and is set up for sweep tubes only. Tube test setup
and test data are supplied for the TV-7 tester series only. This
includes switch settings and bias values as well as minimum and 'as
new' test values. (2) adapters as well as tube test information and
pin-out conversion data are supplied for $25 + $3.50 shipping USA.

Good info to know Garey. Thanks!

I was recently “given” a TV-7C/u along with boxes and boxes of tubes in return for some antenna/tower work performed. These would be a nice addition.

If you also happen to be fortunate to have either the military 1704 adapter (or the Hickok CA-5 adapter) you can also test compactron and other "odd-ball" based tubes on the TV-7. I happen to have a CA-5 which allows the switch settings for the 1704, in the TV-7 tube data, to be used.

Be aware, however, the 1704, CA-5, and CA-4 are very rare. I have only seen a couple in the last decade or so watching various places.

Subject: Re: [DrakeRadio] Compactron Sweep Tube Adapters

Good info to know Garey. Thanks!

I was recently “given” a TV-7C/u along with boxes and boxes
of tubes in return for some antenna/tower work performed.
These would be a nice addition.

73

Peter
VE3AX/7

Its very easy to make adaptors. The hardest part is
finding the Compactron sockets.
There is a great deal of information on the TV-7 at
http://jvgavila.com/tv7.htm

More at BAMA under military There are two entries for
TV-7 which contain different material.

I have two documents with additional information. One
has the settings for compactrons and the wiring information
for the adaptors for both 9 and 12 pin tubes. The other is a
spread sheet from Nolan Lee with additional material and a
chart showing actual Gm vs: TV-7 meter readings. The
settings on the two charts is somewhat different, I think
the ones on the PDF chart (with socket wiring) are correct
although both work. I will send both to you via direct
e-mail.
I find there is a definite relationship between the Gm
readings and power output.

When I get home tonight I'll check the knob but I'am pretty sure it's somewhere inside the PTO that is slipping. How do I get the filter selector switch off so I can pull the PTO out?

Dave -

It's been a while since I've done one, but I believe it just pulls off. Steve could tell you for sure.

The Passband Tuning knob is prone to slippage. It's a1/8" dia shaft, and has a phenolic tube that is 1/8" id, 1/4" od as a reducer for the
1/4" knob. The trick is that the tube has a longitudinal slit cutin it. If the reducer is installed with the slit either aligned with the
knob set screw or 180? away from it, you can tighten the set screw until the knob splits and it will still slip. The reducer must be in the
knob such that the slit is at 90? to the set screw so the reducer can clamp onto the shaft.

Steve -

I think it may be YOU!! :-) I can't think of anything that would make the 40M crystal more subject to failure than the others.

1. 40M is used more than the others and the crystals just 'wear out'.?

2. 18 MHz is where crystal type switches over from fundamental to overtone operation?

3. Resonance in the circuit that overdrives an 18 MHz crystal?

4. Resonance in the HC-6/U holder construction that damages the crystal?

Strangely enough, the 40M (11.0 MHz) is the most common failure crystal in the 2-A/B, so perhaps the 40M answer is the best!!

I think the best solution for that phenolic tube is to replace it with one of Donnie's teflon adapters.

Bill -

Yes, Donnie's adapter works well, and is certainly a more elegant fix. Unfortunately it's considerably more expensive, both for Drake
originally and as 'aftermarket' now.

The phenolic one works just fine, as long as you know the 'secret'.! :-)

Topic: 14278 Message: 14288

Yup - I also emailed Dan and got the info. I've told him I want to order a set. This will be useful more for matching them and as a go/no go test. Since I will have to re-tube a TR-4, this could ultimately save me money, since matched triplets are harder to find and even more expensive than matched pairs...

Subject: [DrakeRadio] Compactron Sweep Tube Adapters

Information!!!

Compactron Adapters - Set of (2) adapters which allow
single section 9 pin and 12 pin compactron sweep tubes to be tested
on TV-7 type tube testers. This lets popular tubes such as 6JB6
6JE6 6JF6 6JM6 6JS6 6JU6 6JZ6 6KD6 6KM6 6KN6 6LB6 6LF6 6LQ6 6LR6
6LX6 6ME6 6MJ6 12BJ6 20LF6 21JS6 23JS6 24JE6 27LF6 30KD6 40KD6 8950
7868 be tested on TV-7 testers which do not have compactron
sockets. The adapters are NOT suitable for multi-section
Compactrons, and is set up for sweep tubes only. Tube test setup
and test data are supplied for the TV-7 tester series only. This
includes switch settings and bias values as well as minimum and 'as
new' test values. (2) adapters as well as tube test information and
pin-out conversion data are supplied for $25 + $3.50 shipping USA.

Yep - 90 degrees is the right angle. You do need to tighten a bit more than the other knobs, but not a whole lot.

You should remove the knob from the shaft, then remove the back off the PBT box, gently remove the disc and shaft assembly and then the slug rack. You will find a spring on the front. There will be grease around the disc and both the bearing surface of the slug rack (small convex "button" and the adjuster on the back cover. Clean all this grease off with IPA (Isopropyl alcohol, not India Pale Ale)

Re-grease the disc, the front of the slug rack shaft and the front and rear buttons. You can use regular all-purpose grease or moly grease. Some folks have even used lithium grease but I'm not certain how long that would hold up.

Put everything back together in reverse sequence of removal. You will need to gently nudge each slug into its tube. After you get everything back together, try it out. After you confirm that it's working properly, re-solder the rear cover in the same places it was soldered before.

Sticking PBT can be due to the slug rack binding up on its shaft (the hollow tube that the slug rack rides on), so it's important that you put a light coating of grease on that shaft.

It's really a fairly simple procedure and once you've done it, you won't believe that you were once intimidated by it.

BTW, don't try to adjust the slug positions when the rack is out of the radio. You should, however, make sure that each slug can rotate within its plastic sleeve, as it's easy to hold that sleeve with needle-nose pliers while turning the slug. Just make sure you put the slug back in the same position it was in prior to moving it.

>eventually even to 20M.

One theory I've heard is it is due to sagging of the internal elements with use (abuse), altering the internal geometry and interelectrode capacitances. One would think this would show up also as drift in the neutralization adjustment? It kind of makes sense when thinking that these tube are designed for pulse operation, and even SSB and CW may be higher duty cycle than the designers intended.

Or it's a conspiracy to engineer obsolescence and get us to buy new tubes more often...

Steve
Good information I've added it to my Drake reference files. Well I got lucky I pulled the phenolic tube out of the knob and rotated it so the set screw had a new spot to press against. Then re-tightened the set screw a little bit tighter this time and it seems to work now. The whole PTO seems a bit stiff tough I may end up taking apart the PTO and do a lube job later on. Right now I have too many irons in the fire I need to finish the Hallicrafters SX-28 first.

Thanks guys
73,Dave

An SX-28. I had two of those beasts and I was going to restore them and never did. Sold them at Hosstraders just before I pulled up stakes and moved to NC. A pity - I really wanted to have one.

Just when I'm beginning to think you might know what you're talking about, you come up with THIS cockamamie story!! Sagging elements!??!
They ain't female.....!

It doesseem it would alter the neutralization. I don't recall ever having to change neutralization on an unmolested set of finals. Course
we ARE talking pretty close tolerances to get the gain they get.

Not really pulse operation, they run at 15734 some Hz (There was a day when I could HEAR that frequency) and typically ran inside a closed
box with 20 other tubes, ALL DAY in many homes.

Yes, I can remember being able to hear line output frequency zinging
from a happy TV. These days I can still hear tones OK but have some
trouble listening, apparently....

I would think the major cause of dropoff in tube performance is the
emissivity of the cathode. I would be really surprised if the geometry
changed much over the years (apart from grids falling into plates, etc).

I haven't done any kind of formal study but when I have tested a number
of tubes on my emission tester, the ones that passed the highest current
were the liveliest RF output tubes. Of course, I have no way to tell if that
is correlated with age, is production spread, or the result of a hard life.

My mom used to think I was hearing things when I would tell her that I could hear whine from the TV. I'm still thinking that the horizontal sawtooth was a fairly low duty cycle. I could be wrong. Google is not helping me tonight.

Must be the sunspots...

Steve
As much as I like Drake radios the Hallicrafters SX-28 has to be one of the nicest looking receivers ever made. Mine is a low serial number H-116268 with matching Jensen speaker. The unit has been completely recapped and just needs a little tweaking to bring the old girl back to full working order. Also thinking of building a reproduction R-12 speaker console for the SX-28 can't wait!

Then re-tightened the set screw a little bit tighter this time and it seems to work now. The whole PTO seems a bit stiff tough I may end up taking apart the PTO and do a lube job later on. Right now I have too many irons in the fire I need to finish the Hallicrafters SX-28 first.

You should, however, make sure that each slug can rotate within its plastic sleeve, as it's easy to hold that sleeve with needle-nose pliers while turning the slug. Just make sure you put the slug back in the same position it was in prior to moving it.

Search the online archives of this group and the Drakelist reflector. There's too much general info to repeat. As for powering it up, just plug it in and turn it on. If there are fans, you might want to blow the dust out first. If no fans, you should add them.

Not being a physicist or anything, the most probable mechanism to me would be loss of cathode emission.

It would be interesting to see if anyone else has noted changes in settings (LOAD and DRIVE, in particular) as the tube ages. Could it be that we have to drive them harder and the lower bands are just more efficient? In other words, we're driving them harder on 80m as well, but there's more "headroom" in the circuit...

Just when I'm beginning to think you might know what you're talking about, you come up with THIS cockamamie story!! Sagging elements!??!
They ain't female.....!

It doesseem it would alter the neutralization. I don't recall ever having to change neutralization on an unmolested set of finals. Course
we ARE talking pretty close tolerances to get the gain they get.

Not really pulse operation, they run at 15734 some Hz (There was a day when I could HEAR that frequency) and typically ran inside a closed
box with 20 other tubes, ALL DAY in many homes.

It's a pretty low duty cycle, because the H-output only fires a short
"flyback" pulse to kick the beam back to the start of the next scan line;
the inductance of the deflection yoke integrates it into the deflection
ramp.
A friend who is a physicist used to ask tech applicants if he had a nuclear
accelerator in his office. Most had no idea the CRT TV qualified...

Jim,.
Back in 1971-73 I worked as control board operator and transmitter engineer at a TV station with 10 black & white monitors right in front of me at arms length. If I thought about it, I could hear the high pitched frequency, but when it REALLY would show up was after an 8 hour shift when I was home, in bed and totally quiet. I think eventually that damn high pitched tone burned out those little hairs in my ears and today I can't hear above 12,000 hz.
I absolutely refuse to have a dental assistant use ultrasonic tools to clean my teeth...the sound goes right to the center of my brain!

Ian -

Thanks Ian. Well that's the obvious answer, but I'd like for someone to explain the 'why' of it. Do MORE electrons have to make the trip
from the Cathode to the Plate for higher frequencies. Do the electrons have to be closer together for the higher frequencies? Does it
require more 'collisions' during the trip?? Something akin to 'skin effect' or ??? Do UHF tubes require bigger, more active Cathode coatings?

I know there's a reason, but so far I haven't been able to figure (or find) it out!! :-)

That's what I'm thinking. I need to find the manual for the TV-7...

Will let you know what I find. It's more a matter of getting a setting that produces a consistent reading with a known-good tube. It's even really not important what the actual number is if all you're doing is matching them.

OK, yes I remember seeing that some years ago. I think it's generally correct, but I don't accept the 'droopy elements', yet...! :-)

Exhausting hot air from the area of the PA DOES extend tube life, indicating that the failure is most likely temperature related.

I still believe that neutralization would be affected, and so far I've not run into that. When I get a 'new' radio and check the power
output, if it's low on 10M I check neutralization first. A couple of times neutralization was off, but not always, yet tubes were 'weak' at RF.

This may be as close as we're going to get! Not too many tube design engineers still around......

I found manuals on BAMA. Unfortunately, the military used photographs that did not reproduce well. I'll have to dive into reading them to see what correlates.

I don't know anything about the 'other' models, but do they have the same button set-up??
Some of the tests you have to push and hold one
button, then press another??I would think the element switches would be the same??

Steve -

"Matching" PA tubes is more a matter of matching grid sensitivity rather than absolute gain.

Drake 'matched' by setting Grid voltage at a fixed level, and then grading tubes by the idle current they drew at that voltage. "Matched"
sets were those that idled within 5 mA of each other at any fixed voltage.

Easy to do in the transmitter, just set idle current for 30 mA with a single tube, and then replace one at a time without readjusting BIAS
supply. Select two, or three, that are closest to the same idle current.

Dan's test data shows the BIAS that resulted in 100 with a 'new' tube, and then the 'maximum' found in a group of tubes, usually 5-15 points
higher. There is a 'MIN' value, about 50 or near halfof a new tube.

The 'double button' test is to reduce the Screen voltage, and thus limit the current.

14316. 4-NB alignment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-12 14:37:47 UTC
From: Steve Wedge
Topic: 14316 Message: 14316

I'm reading the sheet that comes with the 4-NB noise blanker - specifically the alignment procedure. The procedure says to "Tune in a crystal calibrator at 28.5 MHz" Do I need to hook up an external calibrator and align with the function switch in the "NB" position, or do I have the function switch in CAL and adjust while using the internal calibrator?

Steve Wedge, W1ES/4

Steve -

RTFCD!! The 4-NB manual in MISC has the 'correct' alignment procedure.

As to your particular question, you add a clip lead to turn on the CAL in the NB position.

Word of warning.... The 'NULL' adjustment is V.E.R.Y. sharp and easy to miss. You sure won't see it with a DMM!! :-)

I am still researching this. The main limitation on
the high frequency performance of a tube is transit time.
The second limitation is input and output capacitance. The
latter can be to some degree overcome in RF amplifiers by
making the capacitance part of the input or output tank
circuits. Transit time is fixed by the spacing of the
elements. Tubes are made with very rigid structures; grids
do not sag unless very seriously overheated. Keep in mind
that the "processing" of the tube in manufacture, that is
the evacuation, sealing, and gettering, all take place at
very elevated temperatures. I am tempted to agree with
Steve that the main culprit is loss of gain due to loss of
emission. One of the characteristics of tubes often
overlooked is perveance, this is a measure of the efficiency
of the electron emitting system. Perveance tells how much
plate current can be drawn at a given plate voltage. Tube
makers tried to increase the perveance of tubes as much as
possible so that they could operate with good efficiency at
low plate voltages. Perveance is determined mainly by the
area of the cathode and the spacing of the grid from the
cathode. As cathode emission falls of perveance becomes

less. I think all tubes fall off in gain with frequency but that as the tube emission becomes less the effect becomes more obvious because the tube can no longer reach the same plate current at its plate voltage even when driven harder. This may be wrong. I am going over some older books that are quite detailed on vacuum tube operation and may learn more.
BTW, I learned incidently that certain types of getters depend on ionization to work. When a tube is stored for very long periods without use this mode of gettering is ineffective so the tubes may become gassy. I am not sure if this type of getter was used alone in tubes made after about the mid- 1930s. Tube degassers were devided into "getters" and "keepers" at least in RCA parlance. Getters abrorbed gasses while the tube was operating, keepers absorbed gasses while the tube was cold.

Richard -

I think you're getting close!

Perveance is one of the primary factors for selecting sweep tubes for transmitters of the era. There is a considerable price penalty to pay
for 800V rated components over 650 V. Think electrolyticcaps, diodes, wire insulation, etc. of the day. This is one of the reasons why an
S-Line is rated for 100W with it's 800 VDC supply, while Drake was getting 140W with 650. The 6146 isn't nearly the perveance of 6JB6s,
etc. Granted, a 40% increase in output power isn't a big deal, but keep in mind that ham radio manufacturers were in a 'horsepower race' at
the time, as were the audiophile manufacturers.

The 6JB6 can support Cathode currents of as much as an Amp at 650 VDC, which is also what makes them so eager to destroy themselves when
operated out of resonance!!

Having read some more I find my remarks about getters were correct but somewhat premature. RCA at least was very aware of the storage and "keeping" problem and used different getters to obtain satisfactory results. It is evidently magnesium that requires ionization. Later getters used barium compounds along with magnesium or aluminum and there were also combinations of barium and tantalum called Batalum. I am still reading over the series of RCA lectures published in 1940 and will start the much larger version from the 1950's. The lecture series was for RCA personel, Mostly at the tube plant at Harrison N.J. but I think RCA may have published the collected lectures for the public. These are interesting because they are from the horse's mouth so to speak. Tube manufacture was quite complicated and required a lot of specialized knowledge of such things as glass and metalurgy. Many probably know that the obtaining of a very good vacuum is vital. One reason DeForest's first tubes were not successful was that he did not realize the importance of a good vacuum. In fact, in his testimony in patent litigation it turned out that he really did not understand how tubes worked. The need for a good vacuum and means to obtain it were discovered indepently and simultaneously by Irving Langmuir at General Electric, and H.D.Arnold at Western Electric.

This makes sense to me. I visualize a curve of power output (vertical axis) vs. frequency (horizontal axis). Power output is a relatively flat line up to the upper frequency bound and then smoothly falls off as frequency continues to increase.

Then, as perveance / emission starts to fall off due to usage the curve shifts to the left. Thus, RF output on 10 meters starts to fall off. Then, 15 meters, etc. The interelectrode capacitance does not change so neutralization does not change.

Interesting discussion!

Doug -

Yabbut..... WHY does the output fall off at the higher frequencies?

Is it BECAUSE the emission is reduced? WEAK (at RF) tubes still test 'strong' on a tube tester @ 60 Hz.

Is it just a result of emission reduction with use? WHY does it take MORE emission at RF?

We're even relatively close to 'on-topic'. :-)

John -

Nahhh, nobody's keeping score..... There are some areas, especially in the R-4C, where lead dress can minimize (or maximize!) feedthrough
of BFO from the 3rd Mixer back into the IF. There are also instances of hash into the audio in the mid-later receivers being sensitive to
lead placement.

Jim's just a special case.....

I think, but have to do more research, its because it takes more oomph at the higher frequencies due to the usual effects of transit time and interelectrode capacitance, etc but that when the emission is up its not as noticable. Note that full power falls off a little on 10 meters even with fresh tubes. Tube data sheets for transmitting tubes always give information on output vs: frequency. There is usually some frequency stated where the tube will run at full ratings and at lower ratings for higher frequencies. The big RCA tube handbook HB-3 has a chart in the transmitting tube section that gives maximum frequencies for the tubes listed. These vary all over the place. For instance, the old 891, a triode used in high power broadcast transmitters has a HF limit of 1.5 mhz while the 5592 which is rated at 50KW output Class-C is rated at 50Mhz. The 891, however will work up to 20Mhz at helf ratings. I also saw (and will try to find) an ad from General Electric c.1947 for a four digit number version of a 6L6 saying it was rated for RF use. I don't know what was different or if these were really a different design or just selected off the line the way low-microphonic tubes were.
It would be interesting to build a high power tube tester and measure the gain and some other characteristics

of these tubes at RF. The scheme would not be difficult but controlling errors at 30 mhz would take a lot of care. I have no doubt that tubes can test good and yet not work well at elevated frequencies. It would be intesting to measure the Gm at low frequencies and see if it _does_ fall off some for tubes that are weak at high frequencies. It may be that a tube can have a somewhat low but still acceptable Gm on the tester and be perfectly fine in many applications but still be weak at high frequencies. But, I am speculating (a more respectable term than guessing) and what is needed is careful measurement.

Well, in my vivid (but 2D) imagination I see the graph showing tube emission which naturally falls off with increasing frequency. This is true of all the tubes I've ever encountered and I suppose it must be due to the laws of physics, the construction of the tube, the propagation of electrons within the tube, etc. etc. All that stuff is *way* beyond me.

But, if that curve exists (and I think that in general we're all in agreement that it does exist) then when the tube's emission begins to fall off then the curve either shifts to the left or down or some combination of the two. That's when we see the 10 meter output start to drop off. Apparently, for the 6JB6, 30 MHz is near the "knee" of the curve, out near the right hand edge.

If the tubes were 4CX250b's we might not notice the fall-off at 30 MHz but would have to go to a much higher frequency to observe the effect.

I think that it's a near miracle that 6JB6's work up to 30 MHz. Weren't they designed for 15 KHz service?

The 60 Hz tube test for matching 6JB6's is already inadequate. Now we know that they should be matched at 28 MHz looking for similar curves. I just *know* that somebody here is now scribbling furiously on the back of an envelope to come up with some sort of "curve tracer" design for the ultimate in 6JB6 matching technology!

1614 is a "transmitter-rated 6L6" - 21W, 80MHz.

Richard -

Yes, I think we're circling in on the truth.

The 4 digit tube you're thinking of is the 1614, an 'RF rated 6L6'. I don't know if it was selected from 6L6 or what. Interestingly it was
used in the Johnson Ranger, as push-pull _modulators_ .. I could never make sense of that, seems that if it was 'RF Rated', whether it was
selected or special manufacture, would have made it MORE expensive, so why use it as a MODULATOR???

I had not thought of the frequency limit on tubes..... Most transmitting tubes are rated at full power up to a specific frequency, and then
derated above that. That implies a loss of 'efficiency' though, rather than gain??

Actually, the 6JB6 was used by Drake all the way up to 54 MHz in the TC-6 and TR-6, so the 'knee' must be a little further up! :-)

The '6 units both use three 6JB6 (set of 3 matched, $9 according to the manual) and run about 300W input power. No empirical data on output
power..... Probably 150W at best.

I think part of the answer is that 1614 tubes were "ten dollars a ton" as surplus for some time. Johnson probably bought several hundred to a few thousand as stock to use for their various rigs. Relatively few people were aware that the 1614 was a direct replacement for a 6L6. The McIntosh audio amplifier we had at my high school (circa 1960) came with 1614's installed.

Thanks, I found the General Electric ad for the GL 1614
and found the tube in the RCA handbook. There is no RF data
given for the 6L6 data sheet either by RCA or Sylvania. RCA
lists the frequency limit as 80 mhz for full ratings and up
to 120 mhz for 75% ratings. While all the characteristics
are identical to the metal 6L6 RCA refers to the 807 for
curves "within its ratings". Curiously enough the 807 does
not go quite as high as the 1614, which is interesting. It
would be useful to know what the difference is between the
6L6 and 1614.

I think one must be careful about taking the 16khz
design for granted. For one thing a sweep tube is designed
to handle a sawtooth which has all harmonics and must have
them up to a quite high frequency for good waveform and
linearity. Nonetheless, that might only be a couple of
hundred kiloherz. So what other characteristics does the
tube have that suits it to being a linear amplifier for RF?
According to an article in Ham Radio magazine for April,
1968 by William I Orr, sweep tubes are capable of reasonably
good distortion performance and will take quite large
overloads. One characteristic of sweep tubes is the ability
to take short but severe overloads. That may seem contrary
to the wisdom of tuning Drake gear but it seems to be the
case. According to Orr the distortion is greater than the
6146 family but the distortion specs of the Drake
transmitters is quite low so I suppose it depends on the
exact conditions of operation. Of course, one of the
principle reasons for using sweep tubes was their low cost
when new. These were made to be expendible parts of TV sets
where they often were pushed beyond their ratings and had
short lives, so they were available in bulk and cheap.
Sylvania published RF data for their sweep tubes, I
think the only manufacturer that did. I thought I had this
stuff in my archive but can't find it right now.
One possible advantage of the Compactron types over
conventional tubes like the 6146 is the absence of a base.
The Compactron uses a button stem construction similar to
miniature tubes so is free of the longer lead and dielectric
losses of a conventional tube base.
These tubes were designed to have very high
instantaneous plat current delivery. In sweep service the
current is high for the briefest pulse but when mistuned the
tube can draw destructively high current easily.
I have not seen a frequency limit on them, probably
Sylvania has that in its RF data sheets, but, judging from
other beam tetrodes of the general 6L6/807 type its probably
on the order of 60 to 100 mhz.

Hello everyone. I am new to the group and I did a search for the solution to my question, but I did not see what I was looking for. I have a T4C and a R4B that I would like to interconnect. What are the chances of success and is there anything special I need to be aware of? Thanks in advance.

T-4C? As in no pto? That's a rare one!

Should work the same - you'll not use the car osc cable, obviously.

Rick -

I assume you mean a T-4XC. Cable together, with the exception of the CAR OSC and PTO LAMP jacks on the T-4XC. Leave themopen. If you want
to transceive, you'll need to do the 'Transceive Align' procedure, see attached.

I swear I was developing a 1 KHz notch in my hearing from when I worked at testing dispatch consoles. I eventually got smart and cobbled together some dummy loads. Now we have a guy who likes to make as much noise as he can while voice testing wireless mic systems on live speakers, with the volume turned up.

I once astonished a young lady at a jewelry store counter when I asked her if thier burglar alarm was still on. It was ultsrasonic, and apparently she couldn't hear it. I'm probably lucky that I wasn't escorted out by men in uniforms with guns.

Back in the 486 days, it wasn't uncommon to hear computer motherboards "singing" to me. People still think I'm crazy when I mention that....

If I thought about it, I could hear the high pitched frequency, but when it REALLY would show up was after an 8 hour shift when I was home, in bed and totally quiet. I think eventually that damn high pitched tone burned out those little hairs in my ears and today I can't hear above 12,000 hz.

Back when my ears worked I could hear ultra-sonic
burglar alarms and cleaners quite plainly. In fact, there
was a Sears store with something or other I had to go
through on one escalator, it felt like someone stuck
knitting needles through my ears. Others couldn't hear it.
Being in a TV station was awful with all those flybacks
going. Now I say "what" a lot.

Yes, Sears had those too. This one, though, was in a store called Ardan's. It was loud enough to be uncomfortable, and I didn't stay long because I knew that I would end up with a nasty headache if I didn't get out of there. I did not frequent that store, although the last time I was in there before they closed, it was turned off.

At the other end of the spectrum, we have a group that tests the huge amplified stadium speakers at the other end of our building. They damp them as much as they can, and the dB levels at our end are well within safe limits, but it can get downright uncomfortrable when they hit certian very low frequencies. Different frequencies resonate with different parts of the body, and it doesn't help that we are near a wall that reflects the sound back the other direction. You can literally walk through the area and feel the nodes of the standing waves in the air. We have an impedance mismatch...

I'm not sure if the motherboard "singing" was due to load current variations in the onboard core regulators, or actual acoustic resonances in the circuit board traces, but is could have an almost musical character to it depending on what the computer was doing at the time. IIRC the core regulators were still mostly linear in those days, so that leaves acoustic resonances.

Back when, I was politely asked by Uncle Sam to attend a pre-induction physical. Part of that was a hearing test. When I finished that, they told me they would want me on a submarine listening to sonar. I thought that was kind of weird as the sounds I had always heard on tv from sonar scenes had a rather low frequency sound. Maybe everything on tv isn't portrayed realistically?!?!

Only if you wanted to run the tube at full power. I've considered all the ins and outs of this scenario, it's one of those "impractical, but it sure would be fun" projects. Not unlike the European ham who completely rebuilt a TR-7 into a different cabinet.

I don't know, but it still happens! I have a Pentium M laptop from
maybe 2005 that I can easily hear when it does large screen refreshes
in the 2D engine. Another laptop has a touchpad that "chirps" when
you drag your finger across it -- that one makes sense, I'm sure the
capacitive sensor is running in the low 10s of kHz and I'm hearing
some component that could stand a bit of potting. That particular
touch sensor splats noise all across the low bands, too, at least up
through 40m. I can hear it on my TR-4. I assume that's on the
controller/communication side, though, and not the same noise that is
audible.

I was told a long time ago that the singer Jo Stafford
(married to Paul Weston) had _absolute_ pitch. She and
Weston did an album of parody as Jonathan and Darlene
Edwards in which she sang just slightly off-key. I think
this was inspired by a vanity album by a singer whose name I
have now forgotten, some rich person who wanted to sing
opera and managed to make some records which are startlingly
awful.
I remember her as one of the rotating host of the
"Chesterfield Supper Club" a remarkble (for quality) fifteen
minute across the board program on NBC. Another of its hosts
was Perry Como. I have absolutely no on topic Drake
information to add to this.

Thank you for reminding me of Elva Miller, however the
one I was thinking of was Florence Foster Jenkins. I think
Elva Miller was actually a fairly good singer but did
something like what Jo Stafford did. I think probably FFJ
was part of the inspiration for Susan Alexander in _Citizen
Kane_ along with Marian Davies. IMO a very cheap and unfair
shot at Marian who was a very talented commedien and a very
decent person.

14364. Current Draw for new Sylvanias ???

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-14 21:17:52 UTC
From: Michael
Topic: 14364 Message: 14364

Howdy everyone ... Happy Father's Day to those who are. ;-)

My question:

Given a new set of properly neutralized Sylvania 6JB6 finals, in a T4XC, running exclusively CW, on say, 40 meters, with an average duty cycle of 25-30 wpm, how much current draw should I load to (assuming resonance) for optimum tube life?

I find it will go up to 500 mils, at resonance, but I cannot believe that is a good idea ... should it be between 330 and say 400?

Thanks,

Michael, nz4d

Michael -

No, that is not good. Most likely the meter shunt (R59) or calibration resistor (R58) have gone up in value, causing the PLATE meter to
read high. This is not a problem in itself, all you really care about is that the PA is in resonance. A correctly calibrated meter should
show about 350 mA, and 1bout 130-140W output on 40Min TUNE.

Where it IS a problem however is that when you set the idle current for 70 mA on the meter, it's actually only about 40 mA, which is NOT
good for linearity. It can make you very unwelcome to any nearby hams.

CheckR59, (don't forget the test lead resistance,) and you'll probably find that it has gone up to 4 ohms or so. Replace it with a 3 ohm
ceramic composition, 1W, resistor. Then measure its actual resistance and measure the voltage across it in TUNE, GAIN at minimum. Adjust
the BIAS voltage until you measure 210 mV across R59 (assuming it's 3.0 ohms). Then select a resistor for R58 so that the PLATE meter reads
70 mA with the transmitter upright.

You'll probably also want to check the Cathode resistors R53 and R54 and replace with ceramic composition 2W resistors. Also check R50 and
R51, and if out of tolerance replace with 1/2W carbon comps.

While you're in there, check R44 for value and condition, replace with 1/2W carbon comp if necessary.

14366. Drake W-4 Wattmeter PEP Amplifier Board

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-15 16:39:20 UTC
From: Paul Christensen
Topic: 14366 Message: 14366

Just finished the PCB design of a drop-in PEP board for the W-4 wattmeter. The existing meter wires are moved to the barrier terminal strip and the board mounts directly to the meter's 0.25" terminal bolts. The PEP board is powered from a standard 2.1mm coaxial DC jack or +9V battery. PEP/AVG can be switched right on back of the board -- or for those who aren't concerned about preserving originality, bring out the switch wiring to the front panel - but that requires a drilled hole. Super low DC offset op-amps used with on-board LDO regulator. Full RFI protection on the power and input meter leads. Full-scale trim and peak decay rate are adjustable.

A view of the PCB can be seen on my QRZ.com page, about a quarter of the way down the page.

http://www.qrz.com/db/W9AC

I'm wrapping up a couple other board designs but will have 10 available in about 60 days. I'll have more info on pricing at that time and will post here, assuming no objections from the moderator.

14369. set up of a drake c-line

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-15 19:54:03 UTC
From: yash@aol.com
Topic: 14369 Message: 14369

Just finished with cleaning up and getting my C-line up and running. a couple of questions. checking calibration between the two. set the r4c to 14200 and zero beat the dial , then switched in the t4xc and set on spot. Could hear the calb tone on the receiver as I zero beat the t4x dial, should the signal be heard loud like ,say equal to the r4c . the manual mentioned tweets getting slower and slower as you neared zero beat. Never heard any such tweets. Iam I doing something wrong ,or does something need work ?
Also if you never plan to use VOX, can the interconnect cables for the vox jacks be left off?
thanks

14370. TR7 synthesizer problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-15 19:54:13 UTC
From: k6echoecho
Topic: 14370 Message: 14370

I am just setting up my shack with my TR7, after a few years of not being on the air with this rig.
After two years of not using my TR7, it has developed a synthesizer problem, roughly similar as described in an older threat between N8YX and WB2WIK (see below).

My synthesizer error is somewhat more specific as the one described in the N8YX-WB2WIK threat:

If the unit is powered on, the synthesizer sometimes in a reproducible fashion does not follow the band switch but rather ignores band switching.
Observations:
1) It usually switches fine from 21 to 14 to 7 to 3.5.

2) There is hysteresis in how the synthesizer follows the band switching:
To switch to 21 one usually has to overshoot with the band switch to 28. To switch to 3.5 one has to overshoot to 1.5 with the band switch

3) When powered on, the synthesizer never switches to 1.8 or 28.

4) The synthesizer sets ALWAYS correctly to any band set by the band switch (also 28 or 1.5!) after switching the transceiver off and on again.

I followed N8YXes instructions (below), removed DR7 and Digital Control unit, cleaned it and treated everything with DeOxit.
I did not resolder as suggested by N8YX, however, the soldering contacts seem fine and my error persists consistently.
Of course, I also wiggled all the switches that WB2WIK, again the switches seem solid and the problem did not change.

Anyone has a recommendation where I could search for a problem next?

Thanks a lot!

vy 73 de

Fritz, K6EE

N8YX

1) Obtain the TR7 service manual
2) Obtain a bottle of DeOxIt
3) If you don't already have one, obtain a board puller or fashion one yourself
4) Remove wraparound case - 8 screws on bottom of radio
5) Locate DR7 readout board. Carefully remove the DR7 board, following the procedure in the service manual. Be sure to note where the various 5 and 6-pin connectors - along with the 1st mixer and band-select wire

(blue) go
6) Note the large Molex connectors (.156" spacing). Gently re-solder each of the pins from the top side of the DR7 then apply DeOxIt to each of the pins and their mating receptacles. Follow Caig's directions when doing this. Repeat until all oxidation is removed.
7) Install the DR7 into the rig, ensuring that all Molex connectors engage properly. It's tricky at first...but if you've done a gazillion of them it's not that big of a deal.
8) Replace all connectors and wires that you removed in Step 5. Then test rig.

What's happening is that one or more of the pins in the Molex connectors on the bandswitch logic (leftmost) side of the board has become intermittent (via questionable solder connection) or is simply dirty due to oxidation. The procedure described above will get your radio working correctly again.

::Good advice, albeit a fairly complex procedure (mostly removing the cover and unseating all the blind-mate connectors under the DR7 board, which takes a knack).

Before even doing that, you might try rocking these switches:

Bandswitch (front panel)
Auxiliary Program switch (front panel) Frequency counter switch (slide switch, EXT/NORM on rear panel)

If any of those are making crappy contact the frequency counter can act weirdly, as they all have an input to the counter itself.

Dale -

The VOX cable must be connected for 'tweets' AND sidetone to work.

From: Garey Barrell
Topic: 14370 Message: 14373

Fritz -

Unlocked synthesizer. Check the +24 VDC supply.

If low or missing, check the DC-DC converter transformer to make sure both halves of the "E" core are tightly together and the wire loop is
in place around it.

Actually I don'trecall the C-Line having 'tweets', if Iwant to be 'exactly' on frequency I tune the T-4XC to zero beat, AVC on FAST,and
watch for the meter to swing slowly at the zero point. When you SPOT the T-4XC you should hear a loud tone just like the Calibrator. All
you're doing is keying the low level stages in the transmitter.

14375. Re: [DrakeRadio] Drake W-4 Wattmeter PEP Amplifier Board

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-15 23:21:13 UTC
From: Paul Christensen
Topic: 14366 Message: 14375

I'm not sure about mounting clearance but electrically it should work fine although the series meter resistor may need a different value if the internal meter resistance is different than that of the W-4. The board is 3.1" x 1.9" with 1.2" between meter bolt centers.

Paul,

Do you have a peak reading board that will function with the MN-2000 tuner meter?

Thanks,

> Just finished the PCB design of a drop-in PEP board for the W-4 wattmeter. The existing meter wires are moved to the barrier terminal strip and the board mounts directly to the meter's 0.25" terminal bolts. The PEP board is powered from a standard 2.1mm coaxial DC jack or +9V battery. PEP/AVG can be switched right on back of the board -- or for those who aren't concerned about preserving originality, bring out the switch wiring to the front panel - but that requires a drilled hole. Super low DC offset op-amps used with on-board LDO regulator. Full RFI protection on the power and input meter leads. Full-scale trim and peak decay rate are adjustable.

Really nice copper, nice front panel, Cabinet has a few nicks on the rear edge, no scratches. Really nice copper. This one's rare: it has the A-series knob and the PTO has the 5 kHz markings. Most of the ones I see around were from the "B" era.

Contact me off-list for pricing and shipping info.

I'll be testing, cleaning and aligning it this week.

14378. Set Up Drake C-Line - Disable PTO In T4XC

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-15 23:53:03 UTC
From: WD8ARZ
Topic: 14369 Message: 14378

Have a T4XC and a R4C. The previous owner removed the coax cable from the out put of the PTO, and connected where it went to a spare rca phone on the rear panel. The PTO output from the R4C now feeds that location instead. In result is both rigs on the same PTO. Simplifies operation, though it does get rid of split frequency operation. Easy to restore, and I did for testing. All worked as it should when switching options tested. Liked the mod, so put it back.

What the heck is a tweets in relation to the Drakes???

Bill,

You are right, NO tweets needed with the C line. That "alignment" only takes place if you use the T4XC in stock configuration with an earlier R4(X) receiver. The carrier oscillators are tied together when the R4C and T4XC are tied together properly.

The only weakness I find in the B Line is that very thing, the "tweets" to keep them transceiving properly. Gets tiresome in this day, but still love the sound of that receiver!!!!!!

Dale,

The last time I had my C-line in the operating position. I could hear the tweets when I went to zero beat them. On the upper bands (20 to 10 M) I had to listen very hard. As soon as I get the work bench open I will put the C-line on it so I can align and do some PM on the twins. I will post what I find.

Dale, Walter and all,

I will correct my previous statement about the "tweets". I was correct that the need to "align" the R4C to the T4XC doesn't exist, as it does with the earlier R4(x)'s as related on pages 3-5 and 3-6. HOWEVER, when spotting, the two together, you can use Garey's version OR the "tweets" in SSB, see pages 3-7 and 3-8. Although I was thinking of the "alignment" of the rigs. When Walter mentioned the spotting, I read further and sure enough, I should have read the rest of the manual, hi.

From: WD8ARZ
Topic: 14369 Message: 14386

As I had described in a previous email on this topic, the Drake C twins I have were modified before I owned them.

Am familiar with the hetrodyne when zero beating, but had never heard it described the way it was meant here. hi

Note that this pair had been modified such that the only PTO used is the one in the receiver. Its output is fed directly into the T4XC where the internal PTO for that transmitter had been disconnected from.

End result is there is no zero beating required in this arrangement for this pair. Thus no Tweet.

Previous owner was W8RRE, Harry Bedard of Waterford, MI

Thanks again, and 73 from Bill - WD8ARZ

Dale -

I think we've generated as much confusion as clarity. I was nohelp, either, that's what I get for going from memory!

What youneed to know is in Chapter III, para 3-14 of the T-4XC manual. What is not mentioned in this paragraph is the the mic MUST be
'hot'. If you use PTT and the mic is internally shorted or switched off in receive, you will hear no'tweets'. This fact about the mic is
alluded to earlier in the manual, but by the time we get to para 3-14, we forgot! Even if you only use PTT, the mic can still be wired to
be 'hot' in receive, as the VOX of the C-Line (ONLY) can be disabled by pushing in on the GAIN control.

When the T-4XC is set to SPOT, the low level stages of the transmitter are keyed, and the receiver is left in ON, i.e., not MUTEd. When you
tune the transmitter PTO near the receive frequency (CALibrator OFF) you will hear a 'rough' tone. This tone is generated by the receive
audio getting into the mic (feedback!) As you get closer to the receiverfrequency, the interval of the tone will lengthen, eventually
resolving into 'tweets' (short bursts of feedback) which will slow to one tweet per secondor less. This means you are within 1 Hz of the
receive frequency. It will be hard to stay that close, as the PTOs will wander slightly from each other, but you caneasily get within 5 Hz
or so, resulting in about 3-5 tweets/second. I think the ANTI VOX signal from the receiver truncates the feedback, making it more like a
blocking oscillator, resulting in the tweets or short 'chirps'.

So... Those are the 'TWEETS'. Partof the confusion here is because this is the method used in the earlier 4-Line sets to align the CAR OSC
and 2nd Mixer LO together for TRANSCEIVE operation. While crystal controlled, they still directly affect the separation of two in
transceive, and the slight dithering of two crystal controlled oscillators can easily reach 20 - 40 Hz or more. This is too much for SSB,
you'll have people complaining you're "OFF FREQUENCY", as if they knew what frequency THEY were on. But that's another rant! Drake
attempted to resolve this problem in the late R-4A period by selecting CAR OSC and 2nd Mixer LO crystals. The crystals were put into 3 (or
4) groups depending upon their temperature drift characteristics (how much and in which direction), and then color coded with a stripe of
paint on the edge of the crystal. This is the letter at the end of many Late R-4A/T-4X and all B-Line serial numbers, Red, Blue, Green, and
'maybe' Yellow. Since units were sold individually, it was the distributor or owner's responsibility to put colors together for best
transceiver operation. Drake exchanged a lot of crystals at no charge to allow those who ended up with mismatched crystals, so the letter on

the s/n is NOT necessarily definitive, you gotta look at the crystal paint stripe!

All this color coding was eliminated in the C-Lineby cabling a sample of the CAR OSC over to the R-4C, via the 'CAR OSC' cable strangely
enough, and using it to sort of 'phase lock' the 3rd Mixer LO in the R-4C. There is no comparator or fancy circuitry, but the two crystal
oscillators will 'symphathize' (new word!) if they are within a few Hz of each other. Eliminates the TRANSCEIVE ALIGN procedure as well.

Finally, on CW, you zero beat the way I described earlier (I'm 98% CW), i.e., SPOT and either zero beat the other station or match the audio
frequency by ear. Matching by ear worked pretty well in the old days, when most everyone generated their CW signal by shifting the CAR OSC
into the LSB filter passband. Nowadays there is no standard and some generate CW in the USB offset, meaning if you match tones you 'could'
be off by twice the tone you like. I usually use around 400 Hz, so I'm off less than a kHz!If they can't find me when I'm that close ...

Bill -

No accounting for some mods..... He should have just bought a TR-4C!

This might have made some little sense if you wanted transceive ONLY with an A or B pair, or if the T-4XC PTO died?!

Unless this arrangement has some special meaning for you, I would suggest putting them back to normal and having the biggest advantage of
the twins, i.e., separate control _when you want it_. Withthe C-Line you always get perfect transceive _when you want it_, and separate
when you don't, just by turning the switch....

Now that is the kind of feedback I have been used to seeing from this group. Thank you so much Garey.

Because of the modification by the previous owner of this C pair, I was not having to sync the two.

Thank You!

I don't know that I've ever heard the tweet, on my C Line, but I have always preferred my B twins, over the C's. However, the thought of a Drake user, not knowing what the tweet is, seems foreign, to me. I've just run B twins for so long, that it seems automatic, to know what the tweets are, and how you listen for them "slow down" or elongate, as you get it onto frequency. I guess, though, that if you never heard it, it would be difficult, to understand.

From: Steve Wedge
Topic: 14369 Message: 14395

Actually, if you are running them in SPOT and are in SSB mode, you should hear the tweets, because spotting by definition puts the transmitter and receiver into SEPARATE mode - I.e., the CAR OSC signal is not being used to synch the two sets.

14396. Why I Didnt Know About 'Tweet"

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-16 18:03:32 UTC
From: WD8ARZ
Topic: 14369 Message: 14396

Hello Dan, I can imagine it would be hard for you under your circumstances.

In my case I inherited the Drake C line, the only Drakes I have ever had. They were modified before I received them to use a single PTO from the receiver directly to an add on RCA phone connector on the transmitter that went directly to where the transmitter PTO 'had been' connected to. Thus there was never a need to sync the transmitter and receiver to the same frequency. The transmitter PTO was not used by the transmitter.

Out of curiosity I did undo the mode and verified that the T-4XC Transceive switch did function as intended. Did follow the written directions in the manual. Did hear the feedback ... which as far as I was concerned was zero beating process that did sound like feedback. Decided with my Air Force Jet and age damaged ears, and the drift in both rigs crystals and pto's, the best stable tracking for me was with the mod that had been done, so I restored the mod.

Have no plans for split frequency operation with the Drake C line so it is perfectly fine with me and easier to use. Have other gear I can use in split mode for all transmit receive modes / combinations.

In all the years I have been in this group, and I of course have not read all the emails, this past week is the first time ever I have heard the term tweet used. So the question was very valid in my mind.

My HW-7 and other rigs, had a hytrodyne zero beat method I preferred over the feedback version .... hi hi

Love AM, and operate from the base and mobile. The mobile uses a TS-480HX rig that has high temp duty cycle, and is very reliable rig. Uses upward modulation. AM carrier with no modulation is 50 watts, and with modulation hits 100 watts. Great AM performer on the base or mobile. The only 200 watt SSB mobile rig I am aware of.

Bill,
I "get" what you're saying. It's just that as much as I've used two different B Line sets, it seems unfathomable, that anyone who is a Drake user, wouldn't know, until you consider, that there are lots of folks, who have only ever used transceivers.
I certainly didn't mean to sound disparaging, it is just that foreign of a concept, to me, that is seemed odd, that so many folks, were saying that they didn't know what the tweets were. I guess that I always thought is was something that ALL Drake users were familiar with, but I was admitting that I was wrong.

And, I also want to wish all the fathers out there, a Happy Father's Day!

Thanks to Garey and everyone else who answered my questions about sync. my C-line. Put the twins on the air today, first contact was mexico,city on 20. Had a nice 20 minute chat, he was running a flex 5000a. and said the c-line was near dead on frequency and the signal on the scope very good. He played back some audio he recorded ,audio was fine also. Had a second contact in Belize, His report was just fine also. the c-line is VERY stable after about 10 minutes. Thanks again to all , looking forward to using the twins

14399. Drake TR7 - DC Power Problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-17 00:00:26 UTC
From: kd4e2001
Topic: 14399 Message: 14399

A Drake TR7 in unknown operating condition followed me home from Dayton & I am just now getting a look at it.

I've wired a DC cable to the keyed 4-pin connector and jumped pins 1 & 2 on the multi-pin connector that normally goes to the matching PS7 supply.

There is no response whatsoever when I turn ON the front panel switch.

Do I recall correctly that there is an internal fuse?

Thanks!

David

When using a DC Cable, you shouldn't have to jump any pins on the Jones Multipoint connector.

Don -

They will work together just fine. If you wish to have sidetone, you will need a small output transformer (4-8 ohms to 3-5k ohms), but other
than that just plug and play.

The R-4C is a considerably better receiver, with Passband Tuning. The R-4C also has sharper crystal filters as opposed to the Passband with
L/C filters in the 2-C. Also room for more auxiliary band crystals. I personally prefer the 2-C for day-to-day ham operations, but it is
severely limited without the adjustable Passband tuning.

Hi David,

As has already been mentioned, you don't need the jumper on 1 and 2. Those are one section of the power switch, and control AC to the Drake power supply only.

Yes, there is an internal fuse. It is on the right side wall, very close to the front of the radio. It is in the low current +13.7V rail that powers everything in the radio except the PA deck. Replace with the same type and size if it is open. Be careful not to bump the nearby fixed passband pots on the DC-DC converter PCB.

There is also the other half of the power switch that switches the low current 13.7V. It may be open or intermittent, they do go bad sometimes. If the fuse is good, excercise the switch a few times to see if it comes on.

Another possibility is grunge or corrosion on the 4 pin power connector on the rear panel.

That area is very clean and the connector I acquired was NOS.

Hopefully nothing more serious than the fuse ... it was paired
with a PS7 which reportedly had very low voltage output ... I
re-sold it as-is at Dayton.

14406. Tx audio response

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-17 14:31:19 UTC
From: David Winfree
Topic: 14406 Message: 14406

It's very easy now to have a small, portable, zero cost, tunable audio source. In my case, its a iPhone with the Tone Generator Ap. I'm not fooled into thinking the wideband source is linear through the tiny stereo transducers, however. BUT, it does give a somewhat reasonable sound down to a couple hundred Hz and up to past 20,000 Hz as heard by my middle school age daughters. My limit is far lower, unfortunately at around 12kHz. Even for just that test, it makes for some interesting discussion.
But on to the Drake test.

I use a aviation headset of dubious response. Actually have two to choose from. To work into the drake, it took a step-up audio transformer, coupling cap, RF bypass cap, battery, and not much more. None of it bench tested. So, now one can envision a test, where the smart phone is held near the mic, the Tx loaded into a dummy load, and one watches Ip vs audio freq. The T4x is speced at 300 to 2600Hz at 6db down points. I get closer to 600 to 2500Hz at around 1/2 Ip. A TS680 on hand does about 600 to 2700Hz. That is, my plate current falls to about half of max at the low and high audio freq limit. Now I know I'm missing the 300 to 600Hz portion of audio, not sure how important that is. I have received a signal report of "missing highs", which I can now quantify. I noticed the Kenwood has a significant peak at 2500Hz, with the rolloff at 2700Hz.

Has anyone had similar findings on their Drake rig? I'd specifically like to know of Shure 444 or vintage Astatic and other mics response WITH THE Tx attached.
cheers, WB4SPT

Garey:

Thanks for the quick reply. Yes, I like the 2C for just turning it on to listen to the bands...a bit difficult to separate out signals when it becomes crowded, but overall the tone of the sound is terrific.

Am looking at an R4C.

Best

If I understand this right you are using the phone as
an acoustic source feeding it through the microphone on the
headset. I don't quite understand whant the transformer
etc, is for. Are you feeding the oscillator directly into
the transmitter?

I think you have to measure the response of the transmitter directly. Also, do you have a separate receiver you can listen to the transmitter on? Preferably one with a rather wide IF. Use decent headphones and have someone else talk.
My T-4XB may be different than your transmitter but I've tested both by listening on a receiver while it was on a dummy load and from signal reports. The highs seem fine. My usual microphone is an Electro-Voice 664. I've compared this to a D-104 and a couple of others and generally it gets the best report. Its hard to beleive there is a real difference among microphones when going through such a frequency limited system as these transmitters but there seems to be. BTW, I hear a lot of bad audio on the air coming from rice boxes with lots of adjustments. Its fun to hear a couple of folks poking at them.

Dave -

If you could sub the tube, I think I'd do that first. The 0.82 ohm resistor is a 'FUSE' for the HV, and ashort will vaporize it! It should
only be replaced with the same type and value of resistor. They're available fromHarbach Electronics (RES400) in a pack of five (5) for
about$6.

The fact that the resistor didn't blow immediately indicates that the short isn't (or at least 'wasn't' permanent), re-enforcing the tube
problem. The supply is 'probably' ok, but most likely needs new caps, just due to age.

If I'm all wet, one of the amp guys needs to SPEAK UP!! :-)

Iam making up interconnect cables for my C-line, per Garey's write up of cables and types. On the critical cables Iam using 8421. I know I can shorten the other cables, to clean up the mess, why can't the critical cables be shortened ,what does the specified length have on the twins when they transceiver? Just would like to clean up the mess of cables behind the rigs.

Dale -

Your cables can be any length you want them to be, EXCEPT for the two '8421' cables for CAR OSC and INJ.

Those two 'should' be _no more_ than39", (although you can cheat 'some'!), but shorter is NO problem. It's best to connecteveryone up,
then touch up the INJcabletrim caps in both the receiver and transmitter for maxsignal.

Remember, Drake sold receivers and transmitters separately. So 39" was intended to be enough for anyone, and the alignment was 'close
enough' for 39" cables. Thus the reason to tweak up the INJ adjustments with YOUR receiver and YOUR transmitter cabled together for minimum
variation between separate, and transceive operation. There will always be 'some' small variation between which PTO is controlling, and/or
whether transceiveor separate are selected, the above just minimizes these artifacts.

OK, you've eliminated the tube, good..... 'Something' is shorted onthe HV line,probably a bypass capacitor. Likely suspects C27, 28, 30,
31, 42. I seem to recall problems with the 760 pF, 4kV caps in the past, perhaps Evan has some input. the GOOD news is, it's most likely
permanently shorted now, instead of just breaking down under high voltage!!

You DID remember to defeat the HV Safety interlock when testing, didn't you?!?!?! :-)

Dave,
If it still has the original PC board capacitor (C25) mounted on the side of the plate choke, look it over good to see if it is arcing.

14418. was I lucky?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-21 19:02:47 UTC
From: William Houghton
Topic: 14418 Message: 14418

I was working on a T-4XC that is putting out about 80W on 80, 40, and 20, about 40W on 15, and about 10W on 10m. I was thinking the problem could be due to:

- weak finals,
- alignment,
- cathode resistors which measure about 33% high.
- a combination of all three

I have a box of several untested 6JB6's and no tester to test them. I swapped in another pair of finals, turned on the power and to my surprise one of the 6JB6's lit up with a purple glow like an 866 with an ampere through it! The AC-4 now had a horrific hum even when not connected to a rig (shorting the AC switch contacts in the Jones connector).

Replacing the diodes in the AC-4R recap board has fixed the supply. Apparently when I recapped this supply a few years back, right after I bought it, I didn't think to check the fuse. If I had, I would have seen that a 30A fuse was installed!

I consider myself lucky. From this point on I vow to always check the fuses in new old stuff that I get,

73,

Bill

Yes Gary, I have been reading your messages about fuses. I wasn't reading them a few years ago - hihi.

My purpose in posting this was to serve as a reminder to others and myself to check for correct fuses. Fortunately the last time I placed an order with Mouser I bought 100 pcs of Vishay 1N5399's (1KV, 1.5A) for about 4 cents each if I recall.

14421. FS PJ-068 mic connector guide pin screwdrivers

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-22 05:15:37 UTC
From: vacuuminded2@...
Topic: 14421 Message: 14421

For sale, brand new PK Neuses N-2348 guide-pin screwdrivers. These are for the small "switchboard" screws found inside the PJ-068 mic connector, 1/4" key jack, and other mil connectors. These are the teeny tiny screws with a hole in the center, that are darn near impossible to work with. It makes the installation of the mini-screws in those plugs MUCH easier, as it has a spring loaded center pin for holding the screw, inside the slot driver bit.

N-2348 (Weco.KS-2348) (Aeco.H-883182-1) Screw guiding screwdriver for small "hole in head" screws. Guide pin retracts 9/32" (7.1 mm) to position screwdriver for fast screw insertion and removal. Barrel is knurled for a shure grip, blade is reversible. OAL 4 19/32" (11.7 cm).

These retail from Neuses for $27.75, and are made in the USA.

I am offering them to the group for $20/ea shipped to the conUS.

Regards,
Chris kc9ieq

caps from each cathode to ground. Are you aware of any such
mod to the T-4XC?

73,
bill

I'm curious about this too. These appear to be bypass
caps for the cathode resistors. I suppose some degeneration
there would not hurt but I can't think of a valid reason for
having it. Garey will certainly know.

Bill -

I can think of no GOOD reason for doing this, unless they happen to have failed shorted.... Technically it adds a tiny bit of negative
feedback, probably thought by the PO to improve linearity, but unfortunately is a little more complex than that. Inthis case it just means
a little more drive is necessary to the PA, probably _reducing_ linearity in the Driver stage by as much or more! :-) It never ceases to
amaze me how an accountant or doctor or truck driver believes he knows better than a guy who designs radios for a living!

If I recall increasing negative feedback reduces stage gain but widens bandwidth, but that was a long time ago when I studied those details.

I measured both caps with my B&K LCR meter. One was close to 470pF, the other was unstable which usually indicates some defect in the cap. Perhaps the PO removed both with the intention of replacing both and never got to it.

Unfortunately there is no voltage rating on the units, just the tolerance, 5ZU (the specs), and the value. Based on their size, I can't imagine the voltage rating would be very high.

73,

Bill

Subject: Re: [DrakeRadio] was I lucky?

If I recall increasing negative feedback reduces stage gain
but widens bandwidth, but that was a long time ago when I
studied those details.

I measured both caps with my B&K LCR meter. One was close to
470pF, the other was unstable which usually indicates some
defect in the cap. Perhaps the PO removed both with the
intention of replacing both and never got to it.

Unfortunately there is no voltage rating on the units, just
the tolerance, 5ZU (the specs), and the value. Based on
their size, I can't imagine the voltage rating would be very
high.

73,

Bill

Negative feed back does not increase bandwidth. It can
under the right circumstances reduce distortion and is
sometimes applied to the cathodes of _receiver_ RF
amplifiers which are on AVC to compensate for Miller effect
which is the variation in plate capacitance due to the
variation in gain. That would not be of use in an RF power
amplifier. I think the caps were removed because they were
bad and never replaced. One can determine the voltage
rating from the cathode current and value of the resistors.
The RF voltage may be greater at this point. Certainly a
600 volt cap would be more than sufficient. I don't think
this is a critical point needing a precision capacitor; it
just has to be large enough. A mica cap would do fine if
you can't find a suitable ceramic. 5ZU is a high-K cap, if
Drake used that its not at all a critical application.

Bill -

Correct. It also stabilizes gain, resulting in lower distortion products.

Probably disconnected the bad cap and it made things better (improved stability, less 'jittery' perhaps) so he removed the other one as
well! Who knows.

Yes, the maximum voltage on the Cathodes is around 150 VDC, and most disc ceramic caps are rated 600 VDC or more.

14428. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-23 17:58:00 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 14428

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

Finally cracked the case and checked the internal fuse - it was OK.

I replaced the blown backlight meter bulb while I was in there and
tried to wiggle all of the connectors and boards.

No joy. I have 12vdc at the 4-pin DC connector but no response to
the front panel ON switch.

Where should I look next, please?

Thanks! David

David,

Your next suspect is the power switch. There are two sections, one for AC control of the Drake PS-7 power supply and one for the low current DC power rail.

That's not possible with a PS-7. :D

Interesting point, though. Looking at the schematic, the suicide diode only protects the low current rail. I could see blowing the finals when connecting a hard DC source via an accessory power cable. The best safeguard would be to add a suicide diode to the high current rail in the radio, and seperately fuse the high and low current feeders in a custom 4-wire power cable.

14437. Drake items for sale. TR-7, R-7, PS-7 etc

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-24 08:08:58 UTC
From: Clive
Topic: 14437 Message: 14437

Owing to reciving a large repair bill for a service to my car, something has to give and I am afraid it is my collection of Drake equipment.

I currently have my Drake TR7 plus desk Mic and DC lead up for sale on eBay.

Over the next few weeks I will advertise the rest of teh collection on eBay. I have a Drake, R-7 (includes Noise Blanker) RX, PS-7 PSU, MS4 loudspeaker,High power dummy load type 1551, MN-7 ATU with a ready to fit B-1000 Balun, Drake headphones and a TV-3300-LP low pass filter.

All items in good condition apart from the MN-7 which has lost one of the black covers over the push twist control.

I will ship mostly anywhere but as some of the items are heavy, shiping might be a deal breaker!

Sad to see them go but go they must

My user name on eBay is g0ppo so save me and check out my for sale items over the coming weeks.

73 Clive g0ppo

Garey,

Not yet, had a meeting at church last night then electricians
here right now.

Perhaps after lunch ...

Will report back what I discover.

Thanks,

David KD4E

Where would you locate that diode and what diode would you use?

As for separating the rails since the power cord is already
fused one could count that as fuse protection for the high
current rail and just break-out the low current rail.

I could stack two blade fuse holders on top of the 2" long DC
connector & still leave clearance for the fan connector just
above it.

I haven't really thought about it until now. A high current stud mounted rectifier attached to the case somewhere would be best. You need a diode with as high a surge current rating as you can find (within reason) and fit into the rig. It has to absorb the full shorted output current of the power supply long enough to pop the fuse, hopefully without shorting in the process. That's why some call them "suicide diodes", because they often do short to protect the rest of the electronics. What you DON'T want is an under-rated doide that will blast itself open after it shorts, leaving the unit unprotected while there still may be reverse voltage present.

14446. Thumper!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-24 20:19:39 UTC
From: Steve Wedge
Topic: 14446 Message: 14446

I've got an R-4C that does something very peculiar: it THUMPS! It's very intermittent and happens only when first turned on. It's a big THUMP! in the speaker like the sound you get when connecting an audio cable to an audio amp while the amp is on. I've been jiggling connections around the audio output circuit and haven't been able to find the source yet.

Has anyone experienced a similar issue on an R-4C? This one is stone-stock and has been re-capped recently.

14447. TR-7 Stability

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-24 20:35:45 UTC
From: Garey Barrell
Topic: 14370 Message: 14447

I know we've had this discussion before, but just thought I would stoke the fire a bit.

I just spent some time cleaning up my TR-7's after five some years of trouble-free operation.

Well, almost trouble-free. A couple of week ago I had s/n 6xxx sitting on 40M CW for background 'music'. It's there just about every day,
doing the same thing. While doing something else, I heard a 'sizzle-sizzle POP, silence', accompanied by the wonderful smell of burnt
electrons. I've already bored you with the trials of first, having my wife get the PS-7 out from under the desk, and the 'spare' one back
under there. This is the TR-7 that had all but the 300 Hz filter in it, and hadn't been touched since just before the move to VA, so I
decided to pull it as well and replace it with 9xxx.

So once my background music was restored I went to work on the PS-7. This was a fairly simple repair, final diagnosis being the plastic pin
insulator for one of the power transistors cracked or melted, or both, shorting the Emitter to ground and thereby shorting that transistor's
0.18 ohm equalizing resistor across the 12V OUTPUT causing it to overheat and open up. All this excitement was before either the current or
voltage overload protection, so the primary fuse popped.

Turned out three of the four power transistors were blown, and the fourth wasn't feeling too good. The mounting insulators were only
available in quantities of 100, (at 42 cents each!,) but a phone call to Keystone produced five (sample) pieces the next day via FedEx.
Keystone is THE provider of all those 'bits' it takes to put something together. The transistors, upgraded from 2N5301 to 2N5302, from
Mouser, left only the 0.18 ohm, 15W resistor. NTE has a line of power resistors from 0,10 ohms up, but at only 10W. They don't make a 15W
version, but jump to 20W. Of course the 20W version doesn't start until 0.20 ohms.....
The resistors dissipate about 8W at full load,
so I ended up with two 0.36 ohm, 10W resistors in parallel. I discovered that you can order from Newark, and if not a stock item they will
drop ship from the manufacturer at no charge, just the separate shipping charge. The filter caps still show extremely low ESR and showed no
signs of leakage, so left them alone. The Driver transistor checked ok, but I replaced it on general principles. I let the power supply
burn in for about a week, and this proved interesting as well.

There have been various comments regarding the stability of the TR-7 over the years. What better load for the PS-7 than the TR-7? After a
couple of days I noticed that the frequency seemed very stable, so I carefully set it to 7.050.0, right in between the 0-9 and the 0-1
'flipping', and left it. This is sitting on the bench, top cover removed and in a position

where the A/C outlet blows cool air across it at
random. Over the period of a week, morning, day and evening I glanced at it each time I entered or left the room or turned in that
direction, I saw it go to a solid '1' and/or a solid '9' very occasionally. The rest of the time it sat on '0'. That's less than 200 Hz,
and probably less than 150 Hz deviation.

After I finished up the 'other' TR-7 and PS-7 I swapped them out and let those two sit under the same conditions. The results were
essentially the same! I suspect that's a pretty good comment on the stability of at least THESE two radios.

My conclusion is that if your TR-7 is not this stable, I'd be suspicious of the varactor, analog switch and or pot associated with the RIT
circuit that is inside the PTO on ONLY the TR-4CwRIT and the TR-7.

Steve -

Well, no I haven't noticed that. Once in a while the typical transformer 'thump' from the initial current surge, but not through the speaker.

A 'thump' in the speaker of an AC coupled audio amplifier indicates a single pulse, in this case likely a DC shift. Possibly a result of
tube warmup? Capacitor charging / discharging? Is it only at 'cold' turn-on, or 'warm', or both?

Cold only. I've been listening to it for an hour and a half and it hasn't done it even once.

I'm suspecting the low-voltage supply at this point. I've heard that it was marginal to begin with. Maybe temperature-related.

150 Hz? My god, how can you stand it?

Seriously though, I agree with your experience. IMO there's no justification for frequency stabilizing gadgets if the radio is working as it should.

From: Richard Knoppow
Topic: 14113 Message: 14463

I saw the mod and wondered what it was for. A little
further reading found that it was for side-tone leakage. My
T4XB does not have this problem so there is no point in
doing the mod. I thought the note was for the T4XC.

14464. L-4B Softstart

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-25 21:59:02 UTC
From: k4mt
Topic: 14464 Message: 14464

I have been looking at adding softstart to my L-4B. One thing I notice is the logical place to add the softstart relay is between the power switch and the CW/SSB wiper.

The issue I see is the softstart will only work on CW or SSB depending on the position of the CW/SSB switch on power up. From what I see, is there is a good power surge when switching from CW to SSB. So if every time you change the CW/SSB switch you put a big surge on the PS components, is softstart really going to be effective on this amp? I find if I power it up in CW I get hardly no power supply bang.

What am I missing here?

Topic: 14464 Message: 14465

There is a small surge, but it's not anything to be concerned about IMO. The surge that worries everyone is the one that happens when you apply full rectified voltage to completely discharged filter caps. When you switch from CW to SSB, the caps are already partially charged.

I routinely turn on my amps in low power mode, it does reduce the inrush surge quite a bit.

Gary,

Opinions vary. Personally, my "soft start" is a pair of thermistors installed in the primary circuit of the filament transformer. Too, I have an external on/off switch I use (advertised as soft start but in fact it is not) to ease the burden on switch contacts.

There is an old wives' tale and opinion circulating that the surge from CW to SSB is greater than turning the amp on. Unless one defies the laws of physics, this is virtually impossible. Why? When you turn the amp on in CW, the capacitors are not charged and have to go through several AC cycles to get the HV DC up to 1,800 volts. When you go from CW to SSB, the extra "charging" has to go from 1,800 volts to 2,500 volts. So, in one case you're going from zero (uncharged caps) voltage to 1,880 volts while in the other case the delta (partially charged caps from 1,800 to 2,500 volts) is only 700 volts. Interested parties can do the math.

There is yet another myth being circulated that the 3-500Z is an instant on tube. Sadly, this too is not true even if you read it in the various handbooks and Eimac literature. How can this be? First, if this were true, you would not need a soft-start circuit. So why do companies sell the soft-start circuit and why do some companies put soft start circuits in their 3-500Z amps to save the filaments from onset surge (i.e. a cold filament draws more current than a warm one)? I actually believed this myth. Once I wanted to snag a DX station on the spur of the moment. Hit the on switch then the PTT switch. Trust me, it was not an instant on situation and a couple of hundred dollars later I fixed things. Too, in an "instant on" situation, one is expecting the filament to instantly start emitting electrons at "max" while at the same time attempting to draw plate current. Not a good situation. I guess we're splitting hairs here because even if the tube were instant on, the HV DC is not so the "system" or amp is not instant on. One has to follow one's beliefs. I for one do not believe the tubes are instant on.

On a final note, I talked with an engineer at R. L. Drake when they were in business. He said that the HV DC does not need a soft start circuit because the DC resistance of the HV transformer limits the surge current to the rectifiers and capacitors.

I was pressed for time and didn't want to log onto Yahoo to post the above which for sure would have resulted in me being flamed.

Best of luck and, follow your heart...

73,

Evan

Evan -

You posted just fine!! And we don't 'FLAME' here..... We may however disagree from time to time! :-)

I put a 'soft-start' consisting of a solid-state delay relay and a DALE wirewound resistor in my L-4B back in th 70's. I set the time delay
so that when the amp is switched on the meter lamps and filaments slowly get brighter for about three seconds, therelay clicks and they go
the rest of the way to full brilliance. It makes a smooth ramp up from dark to full light, and if you didn't see the slight flicker when
the relay closed you'd think it was just slow to warm up!!

I can't say for certain if the 3-500Z's are 'instant on' or not, or whether a soft-start is worthwhile, but the L-4B still has the original
3-500Z's in it, and still puts out 1300 W with no strain.

Trust me, it was not an instant on situation and a couple of hundred dollars later I fixed things. Too, in an "instant on" situation, one is expecting the filament to instantly start emitting electrons at "max" while at the same time attempting to draw plate current. Not a good situation. I guess we're splitting hairs here because even if the tube were instant on, the HV DC is not so the "system" or amp is not instant on. One has to follow one's beliefs. I for one do not believe the tubes are instant on.

IMO, Evan is spot-on. I never bought into the instant-on thing either. There are other things besides the filaments in those tubes that need to come up to temp. I try to let the amp idle for a few minuted before I hit it with RF. My NCL-2000 doesn't give you a choice, it has a time delay relay for heater warm-up. I'm told that you can pull chunks off the cathode of a ceramic-metal tube if you tre to use it before the heater is up to temp. I've never felt compelled to test that theory.

As for the inrush, I still have a soft-start here in the box (I think I got it from Evan). Someday I'll install it in one amp of another, but the inrush when turning it on in CW mode just doesn't disconcert me all that much.

>>
>> There is an old wives' tale and opinion circulating that the surge from CW to SSB is greater than turning the amp on. Unless one defies the laws of physics, this is virtually impossible. Why? When you turn the amp on in CW, the capacitors are not charged and have to go through several AC cycles to get the HV DC up to 1,800 volts. When you go from CW to SSB, the extra "charging" has to go from 1,800 volts to 2,500 volts. So, in one case you're going from zero (uncharged caps) voltage to 1,880 volts while in the other case the delta (partially charged caps from 1,800 to 2,500 volts) is only 700 volts. Interested parties can do the math.

>> There is yet another myth being circulated that the 3-500Z is an instant on tube. Sadly, this too is not true even if you read it in the various handbooks and Eimac literature. How can this be? First, if this were true, you would not need a soft-start circuit. So why do companies sell the soft-start circuit and why do some companies put soft start circuits in their 3-500Z amps to save the filaments from onset surge (i.e. a cold filament draws more current than a warm one)? I actually believed this myth. Once I wanted to snag a DX station on the spur of the moment. Hit the on switch then the PTT switch. Trust me, it was not an instant on situation and a couple of hundred dollars later I fixed things. Too, in an "instant on" situation, one is expecting the filament to instantly start emitting electrons at "max" while at the same time attempting to draw plate current. Not a good situation. Side note prompted by Jim NU0C's posting...

Even if a 3-500Z were instant on, the HV DC is not instant on and takes a small amount of time to come up to full voltage. Being politically correct, it all depends on what you mean by "instant on"...

Hello.

I'm liquidating my projects.

For your consideration, I have the following as a package:

TR-4 with NB, receives ok but weak output.
RV-4, not working on one position.
AC-4 works but not upgraded.
DC-3 unknown state. But have cable and both
end connectors for the TR-4.
DC-3 second one and unknown state.
MS-4

R4A all there but no receive.
MS-4

Make offer for all as one and don't forget about

shipping and packaging. Local pickup welcome.

14473. RCA Tube manufacturing books

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-26 07:33:30 UTC
From: Richard Knoppow
Topic: 14473 Message: 14473

I am once again going to recommend the two books on tube manufacture that RCA published for its tube division employees. These are available at http://www.tubebooks.org One was published in 1940 and the other in 1962. I have been reading the later one. It is a treasure of information for those who have more than a casual interest in vacuum tubes. I am posting to this list because many here have asked about problems with the tubes Drake chose to use for the final amplifiers in several of the rigs. There is also some enlightenment on high power tubes. Reading will demonstrate that tubes were far from trivial to make. RCA seems to have been genuinely concerned with quality and life. You will learn what a sealex machine was and at least something about getters and how they were applied and work and some problems with heaters and cathodes.

14475. "Thumper" update.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-26 11:22:33 UTC
From: Steve Wedge
Topic: 14475 Message: 14475

So far this morning, no "THUMP!".

I re-flowed the solder around the new can caps' tabs and soldered a second tab on the low-voltage supply to the chassis (it was moving a little when I pressed on it). I also re-flowed the solder on the tab of the HV cap.

The set has been running normally for about 20 minutes so far.

I'm glad I don't have to look for an intermittent component

14476. Grease vs oil in the PTO

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-26 12:01:52 UTC
From: Steve Wedge
Topic: 14476 Message: 14476

Some observations I've been making suggest that it's probably better to use grease in the PTO bearings and not light oil.

All of the really "mint" or near-mint rigs I've seen lately have no contaminants on the Nylon gears. All of these PTO's still have grease visible around the bearings.

All of the sets I've seen with oily Nylon gears have very little grease on these bearings but do have signs of oil.

Since petroleum oil is known to distort Nylon over time, I'm forming a hypothesis that at least some Nylon gear deforming issues came from a well-intentioned owner or repair person applying oil to the bearings. The oil inevitably leaks out the front and dribbles down the pinion gear, where it then transfers to oil to the Nylon gear.

Perhaps Bill Frost would know the answer to this as far as what was used at the factory (including the type of grease). That R-4 I had and several other sets in excellent condition still had grease in place (and it was not congealed). Those sets, I've merely added a small amount of grease to. I know from now on, when I need to clean out dried grease, I'll be taking the whole thing apart and using grease on reassembly. It also will help with keeping those pesky ball bearings in place during reassembly!

73,

14477. Re: [DrakeRadio] L-4B Softstart

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-26 12:56:02 UTC
From: GALE STEWARD
Topic: 14464 Message: 14477

I had a Softstart module in my L4 for awhile but removed it after I had a problem with it. I repaired it but never reinstalled it. I used the under chassis space to install a solid state AC relay to take the high AC current load off of the L4 front panel switches.

I also built and installed a bias board (operating bias and cutoff bias). I never cared for the design that Drake used in the L4/L4PS in that they use a tap on the low end of the bleeder resistor string to obtain the cutoff bias for the tubes. If the bleeder string opens (a common problem) you can lose the tube cutoff bias voltage.

There is a small surge, but it's not anything to be concerned about IMO. The surge that worries everyone is the one that happens when you apply full rectified voltage to completely discharged filter caps. When you switch from CW to SSB, the caps are already partially charged.

I routinely turn on my amps in low power mode, it does reduce the inrush surge quite a bit.

>I have been looking at adding softstart to my L-4B. One thing I notice is the logical place to add the softstart relay is between the power switch and the CW/SSB wiper.
>
>The issue I see is the softstart will only work on CW or SSB depending on the position of the CW/SSB switch on power up. From what I see, is there is a good power surge when switching from CW to SSB. So if every time you change the CW/SSB switch you put a big surge on the PS components, is softstart really going to be effective on this amp? I find if I power it up in CW I get hardly no power supply bang.

From: K9sqg
Topic: 14476 Message: 14478

While I've not had the need to make decisions about oil versus grease on Drake radios, in similar applications with brass or steel gears I have used a silicon based grease made by GE; the originals ones I'm not sure where I bought them, but in recent years I found some at Surplus Sales of Nebraska. In some instances, I have applied the grease over 20 (yes, twenty) years ago and it still provides lubrication like always, hasn't hardened, etc. It came in three viscosities--light, medium, and firm. Not sure if it is compatible with other lubricants and I have never used it on nylon gears. Just sharing an experience...

Enjoy those Drakes!

Subject: [DrakeRadio] Grease vs oil in the PTO

Some observations I've been making suggest that it's probably better to use grease in the PTO bearings and not light oil.

All of the really "mint" or near-mint rigs I've seen lately have no contaminants on the Nylon gears. All of these PTO's still have grease visible around the bearings.

All of the sets I've seen with oily Nylon gears have very little grease on these bearings but do have signs of oil.

Since petroleum oil is known to distort Nylon over time, I'm forming a hypothesis that at least some Nylon gear deforming issues came from a well-intentioned owner or repair person applying oil to the bearings. The oil inevitably leaks out the front and dribbles down the pinion gear, where it then transfers to oil to the Nylon gear.

Perhaps Bill Frost would know the answer to this as far as what was used at the factory (including the type of grease). That R-4 I had and several other sets in excellent condition still had grease in place (and it was not congealed). Those sets, I've merely added a small amount of grease to. I know from now on, when I need to clean out dried grease, I'll be taking the whole thing apart and using grease on reassembly. It also will help with keeping those pesky ball bearings in place during reassembly!

From: <pulsarxp@...>
Topic: 14476 Message: 14479

I purchased a new C line from Drake when they first came out. I immediately had PTO dial problems. The mechanisms would bind up. I wound up getting three PTOs installed before my PTO problems went away. This was the beginning of plastic gears for Drake. I was told the following by Drake:
1. Never run the PTO to the end stops and bang the VFO dial against the stop. (This is what killed my three PTOs. I don't know if the "banging" distorted the gears or not, but I suspect this is what caused my binding problem). After I stopped doing this I had no more problems.
2. Sometime later I was told by Drake to NEVER put any lubrication on the plastic gears as they will swell and cause the mechanism to bind. (I never did this to my PTOs, so I never experienced this problem).

I've followed these instructions to this date and never have had another PTO problem except for some problems inherited from later equipment acquisitions.

I think it was even Bill Frost who told me some or all of this information.

There are special greases, probably not petroleum based, that are intended for nylongears. I've never seen any, but supposedly they're out
there. Everything I've seen says that nylongears do NOT require lubrication, they are naturally slippery enough to not need it. I suppose
you could put vegetable oil on them if you wish, and your receiver could smell like popcorn!

Oil running down the front of the gearbox from the ball bearings merely indicates that too much oil has been applied by one of the 'if a
little is good, a LOT must be better' brigade. Less than a full drop is plenty. Same for the lead screw, and the rider bar should NOT be
lubricated at all.

The grease used initially at the factory was said to be axle grease, as used to pack front wheel bearings on cars. It was fairly sticky,
and those of you who have repacked bearings know what it looks like when it gets old. The stickiness gave the tuning a smooth feel without
the expense of a flywheel or weighted knob.

Grease is not required for lubrication purposes as the load on the bearings is so light. The best argument FOR grease on the ball bearings
is that it holds the suckers in place while you finish assembly! :-)

It would be useful to know what the gears are actually
made of. Both Nylon and Delrin were used for gears but
Delrin is more suitable because it has a very low
coefficient of friction, (its slippery) and very good
dimentional stability, neither of which is true for Nylon.

I did some research on both, Delrin appears to be restant to petroleum products since its recommended for fuel system parts. It probably does not need lubrication. I am not so sure about Nylon, which I think absorbs moisture.
Grease is oil held in a binder. Common binders are metallic soaps. Greases are used where there is not enough movement of the parts to keep an oil film formed. The properties of the binder are very important. Synthetic oils and greases are made from silicone rather than petroleum and have the advantage of being highly resistant to oxidation and evaportion of lighter components but there is a very wide range of petroleum oils and greases some of which are also very long lived and resistant to oxidation or chemical break down.
My understanding is that neither Delrin or brass needs lubrication.

I do suppose if you want an extremely light touch on the knob, you could use the same sort of lube that skateboarders use on their wheel bearings and set the tension for minimum without side-play. It's a PTFE lube designed for the wheel bearings in skateboards. I wish I still had the tube that my younger son had left somewhere but it disappeared when we moved to NC. The stuff was wicked expensive!

I've found that the tube of moly-based CV joint grease works well (I'm using the stuff on the PBT as well). It's definitely less stiff than wheel bearing or even GP grease.

If the gears are nylon I wouldn't think that any type of lube would be needed. Delrin is much harder then nylon and a little silicon based grease probably wouldn't hurt. Here's a product that some printer repair shops use http://www.fuchs.com/fuchs_chemplex.php Chemplex 710. The gears on my R4C are dry no lube at all and the PTO spins fairly easily, The T4XC is another story someone in the past put some sort of grease on the gears and now even after a complete over haul I still can't get a smooth running PTO. So I would just clean the gears with soap and water and reassemble dry and hope for the best that the gears haven't swelled up from improper use of grease.
Gotta love that B-line the PTO's on these are smooth as silk!

John -

I went to my files and pulled out the drawing for this modification. The relay I used was a P & B CUA-42-70120, which was found in a
surplus store in VA in 1978! This 'was' a 120V, 120 second delay relay, but after I opened it up and selected a new resistor it became a
4.5 second delay! The L-4B was wired for 240 VAC, so I put a 5k, 10W Dale resistor in series with the coil. The N.O. contacts were placed
across a 150 ohm, 50W Dale resistor in series with the AC input of the AMP. Both Dale resistors were the gold, metal case designed to be
bolted to a metal plate. The nice thingis that if the power drops out, the relay resets immediately, so the time delay applies even if
power is reapplied immediately.

As I recall, the relay was $2 and the resistors were $1 each, all at surplus.

Now the bad news....

The relay now is $140 from Newark...! The resistors are $3 and $8 respectively... So one of the current products would probably be a better
approach! :-) Looking through the information in the file, it became apparent to me that I was more interested in protecting the power
switch than the amplifier or power supply. Along those lines, the original switches are still in place aswell.

Delrin has lower friction than Nylon and better
resistance to abrasion and wear. Delrin does not usually
need lubricant. I wonder if the gears were made of Nylon
since Delrin is a better material for mechanical parts and
was certainly available at the time.

Bill,
You might contact John Klewer N6AX (call sign at speakeasy dot net), down in Placentia. I had formerly been told that he didn't work on the older stuff, but he recently fixed an FT-101E, for a friend, so he might be amenable, to a set of "B" Twins.
Otherwise, there is a fellow, up in the Antelope Valley, who does work, on newer, and older, rigs. I'll see if I can find out more info, on him. He repaired an SGC SmartCube for me, and I was very happy with the results. But, I can't find his contact info, right now.

14492. L-4B Tube life Full power or Low Power

Yahoo group: DrakeRadio (2013-01 — 2013-06)

I have read that 3-500Z tubes get maximum life when operated full throttle with 100 watts drive and amp in SSB position. Others say operating at lower drive and lower output puts less stress on the tubes and they therefore last longer.

Not being a 3-500Z expert I have pondered each view, tube specs etc and I can not reach a conclusion. What do the experts here think is best operation for the expensive 3-500Z tubes. I know about Fil voltage etc I am just interested in full vs lower power effects on tube life.

Bill,
Here's what I found about the fellow in the Antelope Valley:
http://www.eham.net/reviews/detail/1705
Now, all of the reviews seem to be very glowing. But, I have heard a couple of folks, who were unhappy, but, apparently they didn't feel strongly enough, to write a review, so, who knows?

Operate the tubes within their specified limits, never, ever, exceed maximum allowable grid current, and keep the envelope and seals cool, and the tubes will outlast you, even if run at max amateur (ICAS) ratings. Consider that in commercial service a 3-500Z will last for 5 years or more when run 24/7 at max commercial (CCS) limits, and translate that to amateur service where the "real" duty cycle is something like 5% when averaged over the life of the tube (you do have to stop to eat and sleep sometime, and maybe even go to work once in a while, right?) - and you can see that a a pair of 3-500Zs will last essentially indefinitely if not abused. I have a Drake L-4B that I purchased circa 1972 or thereabouts, and it still puts out 1300 watts when asked. The only trouble I have ever experienced was a desoldered heater pin due to a faulty socket (not the tube's fault, and I fixed it myself).

I don't know of anyone. If you find someone suitable, be sure and let us know. This comes up from timeto time, and with the way freight
charges are increasing it's only going to get worse!!

Any 'competent' repair person should be able to repair Drake 4 Line stuff, there is no unicorn poop in them and most parts are readily
available. A general tune-up can be done very well just by following the procedures in the manual. The power supply is just a rebuild, and
anyone who can read and do a passable job of soldering can do that.

As a former broadcast engineer, I think the worse problem is heat. Also, if you have bias voltages, they need to be maintained. I like the idea of using DC filament voltage if it can be afforded. Time delay for start-up high voltage is not bad either. I am not sure of the optimum value, but you can add series resistance to AC filament voltage. You want a series sacrifice resistor like a 20-watt 10 ohm wire-wound resistor in the B+ lead.

Gary,

Well, I've operated 3-500Z amps for over 30 years in the form of L4, L4B, L7, and L75, not to mention an occasional SB-220 and Swan Mark II. I tune my L4B and L7 amps in SSB mode, for maximum output within max grid current for the tubes. Then I use the mic gain control on my transceiver to keep output power at 900 watts PEP output. Given that all of these amps were used, and for which I had no history of use and abuse, I have had no 3-500Z tube failures. Your mileage might vary.

Don,
We are 10 miles east of the dam, at Tenkiller Ferry Lake. The address is a Vian zip code, but that likely doesn't tell you anything more than Evening Shade, does. We are east of the interchange of OK 100/82, at the intersection of D4560 and Evening Shade Rd.
We are still actually in process, but, officially have OK driver licenses and OK voter registration, as well as the address on file with the FCC, so it's official, but not technically accurate.

Topic: 14492 Message: 14500

I have two guys that repair amps and they keep telling me the people who do not run their 3-500z tubes at full output and throttle them back have a much higher tube failure rate than those who run them full output wide open all the time. I can see no literature that supports this claim but they insist that it is true. They are old time tube amp guys, one who was a RF engineer on high power transmitting equipment.

I argued with him but he insists that 3-500z unlike ceramic tubes, were ment to be run al full drive and full output. This makes no sense to me.

Thanks for the feedback.

Tempting bait for the engineer with "nothing to do" and a large quantity of cute 120v power relays that I'm pretty sure fit under the L4PS chassis. Leftovers from the appliance control days
BTW, you might want to take a look at ICSOtimer module
These are relatively inexpensive postage stamp size encapsulated thick film circuits with four leads. Two leads are wired in series with a standard relay and by choosing the resistor across the other two leads the relay becomes a user defined time delay relay that times from the application of power and resets on power fail.

Gary -

This is true. Running these tube at full power heats up the plates and causes them to 'getter' (gather and adsorb) gas molecules keeping a
hard vacuum and reducing if not eliminating Grid emission.

Failures are caused by too much Grid current, too little air on the glass-metal seals, and sockets with poor tension. Weak sockets resultin
excess heating, sometimes enough to melt the solder out of the pin, which is a 'runaway' condition. As the solder crystallizes, the
resistance increases, the pin heats, the glass metal seal can no longer be kept cool and things just spiral out of control.

PreWW-II, EIMAC tubes had a reputation for longevity among those who ran them full bore with red hot plates. At that time the plates were
made of tantalum and acted as excellent getters. Those who 'babied' them complained that they had a short working life!

Tantalum plates were discontinued because of cost, but an alloy was designed by EIMAC to give a similar effect.

Running at reduced power also results in higher Grid current, which is one of the ways power tubes are destroyed. When you have your
amplifier tuned properly and Grid current where it should be, reduce the LOAD control and watch the Grid current rise!

There is a lot of good information on the W8JI.com site about amplifiers, tubes, and their foibles....

I think this may be the belief that the plates must run very hot for the gettering action to function. It may have been true of the tantalum plates used in the 1930s and 1940s but not the type which has been used since. Glass tubes do tend to become gassy durring long storage but that is due to leakage around the seals. Ceramic tubes last forever. I think Eimac has data somewhere about tube ratings and life. Worth looking for. I can't see that pushing a tube right to its limit all the time would do anything but shorten its life. The main limit on life of a tube, assuming its not damaged by excessive heat, is the emission of the cathode. Excessive output will tend to shorten cathode life. The other problem is heating of the grids from excessive secondary emission or dissipation. If they get hot enough they can sag or warp. Another problem is inadequate cooling of the seals which will eventually cause leaks. There is a reason for two sets of ratings on many tubes, the CCS and ICAS. Generally, CCS ratings result in longer life. ICAS is given for reasons of economy where the tube is not going to be run hard for very long at a time. CCS is for _continuous_ service so the ratings are rather lower.

I wonder if your RF engineer friend can give you some
sort of citation about this. I could be wrong but my opinion
is based on reading engineering recommendations from Eimac
and RCA.

Hi, Dave -

It's the PTO bearing itself that gets lubed: the centre of the shaft that's moving the slug in the PTO coil. The gear at the other side of that bearing is brass or bronze on all the radios.

No other lube was ever necessary with any of the Nylon gears. It's the ball bearings on the back side that get lubed.

Subject: [DrakeRadio] Re: Grease vs oil in the PTO

If the gears are nylon I wouldn't think that any type of lube would be needed. Delrin is much harder then nylon and a little silicon based grease probably wouldn't hurt. Here's a product that some printer repair shops use http://www.fuchs.com/fuchs_chemplex.php Chemplex 710. The gears on my R4C are dry no lube at all and the PTO spins fairly easily, The T4XC is another story someone in the past put some sort of grease on the gears and now even after a complete over haul I still can't get a smooth running PTO. So I would just clean the gears with soap and water and reassemble dry and hope for the best that the gears haven't swelled up from improper use of grease.
Gotta love that B-line the PTO's on these are smooth as silk!

least some Nylon gear deforming issues came from a well-intentioned owner or repair person applying oil to the bearings. The oil inevitably leaks out the front and dribbles down the pinion gear, where it then transfers to oil to the Nylon gear.
>
> Perhaps Bill Frost would know the answer to this as far as what was used at the factory (including the type of grease). That R-4 I had and several other sets in excellent condition still had grease in place (and it was not congealed). Those sets, I've merely added a small amount of grease to. I know from now on, when I need to clean out dried grease, I'll be taking the whole thing apart and using grease on reassembly. It also will help with keeping those pesky ball bearings in place during reassembly!

Gary -

This is true. Running these tube at full power heats up the plates and causes them to 'getter' (gather and adsorb) gas molecules keeping a
hard vacuum and reducing if not eliminating Grid emission.

Failures are caused by too much Grid current, too little air on the glass-metal seals, and sockets with poor tension. Weak sockets result
in excess heating, sometimes enough to melt the solder out of the pin, which is a 'runaway' condition. As the solder crystallizes, the
resistance increases, the pin heats, the glass metal seal can no longer be kept cool and things just spiral out of control.

PreWW-II, EIMAC tubes had a reputation for longevity among those who ran them full bore with red hot plates. At that time the plates were
made of tantalum and acted as excellent getters. Those who 'babied' them complained that they had a short working life!

Tantalum plates were discontinued because of cost, but an alloy was designed by EIMAC to give a similar effect.

Running at reduced power also results in higher Grid current, which is one of the ways power tubes are destroyed. When you have your
amplifier tuned properly and Grid current where it should be, reduce the LOAD control and watch the Grid current rise!

There is a lot of good information on the W8JI.com site about amplifiers, tubes, and their foibles....

Came to me..... Zirconium is the material I was trying to recall. Initially it was alloyed into the metal anode, but later and I believe
up until the end, was coated on the outside of the Plate. It must be heated to at least dull red to work, again giving rise to the
longevity of the tube being related to how hard it's pushed!

So Platesred, glass/metal seals cooled, recommended Grid current, slightly low (4.9 VAC) filament voltage.

Eimac as I recall noted a 3-500Z's life would be 20,000 hours, but that has so many variables.

The tubes should run warm, very warm orange like to work effectively but I have used a pair in my L7, original tubes since 1979 mostly in the low tap CW position running 500 watts using the SSB mode and they are still good tubes. I also use the amp with a Orion running about 100 watts of carrier in the AM mode, which equals 400 watts peak power in the low tap position as well, no issues. Some guys really want to drive the tube and its a rugged transmitting tube for the service we use in Amateur radio, however I see no need from a practical standpoint to try to drive the amp fully regarding the insignificant signal increase and the life of the tube. I know you can run the 3-500Z at lower power levels with no issues as noted, but when running at about 1750V keep an eye on the grid current, lower voltage will result in higher levels of grid current, higher voltages will result in lower grid current. I belive the grid current on a 3-500Z should not run
over 160 mils and should work well at 80 to 100 mils.

For decades I have heard it said that letting the Eimac 3-500Z tubes develop some anode color once in a while
would prolong their life by gettering. Makes good sense so I have done that with my Eimac tubes.
But what about the newer graphite anode 3-500ZG tubes ? I called RF Parts (who market those Chinese tubes)
and the techs there have no idea whether there is gettering on the graphite anodes or not !
So not sure if anode color does them any good.

As for the thread on soft start for the L-4B .... Ameritron makes a soft start for $80 that eliminates the need to
do any mods to the classic amp and also eliminates the need to toggle the fragile L-4B power switch at all.
check out the Ameritron ICP-240 gl Jim

Cool. The only tricky point is if you go past that null, it's pretty sharp! The scope makes it easier still since you don't have to get a
needle inmotion! Jeff told me oncethat almost every one he saw was misadjusted, and my experience has been just the opposite..... Of
course he's seen LOTS more than I have..

The 'really' neat thing about that approach is that most all those 'relays' only switch the power on at a 'zero crossing' point.

Jim -

I have no realinformation on the 'ZG tubes, but the Zirconium coating is described as imparting a dull, flat gray surface to the graphite plate.

The data sheet for the 3-500Z 'states' that thetube is intended to run with the anode a "visibly red" color.

By the way, thereis NO reference to 'instant on' regarding filament power. The only caveat is to limit inrush current to a cold filament to
twice the operating current (nominally 14.6A) to minimize mechanical stresses on the filament structure. I suspect that the transformer
winding and filament choke resistance will take care of that in the L-4B, but I don't know that for a fact. Another reason for my 'slow'
start!!

From: Steve Wedge
Topic: 14516 Message: 14520

I had an excellent General Radio, I think the model was 1856, VTVM before I moved to NC. I sold much of my test equipment before I moved as a lot of it was kind of old and bulky. I've since picked up a few things as I've needed them and have considered the Elecraft generator - except that it won't do 50 KHz.

The setup of the NB was quite simple, except there's no Brown/white wire. Knowing that the Calibrator gets turned on by grounding it, I metered the pins and played with the switch . I just couldn't remember which pin was pin 2 on that connector.

14522. Ameritron ICP-240 is not a soft start?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-28 15:37:05 UTC
From: K9sqg
Topic: 14492 Message: 14522

I use an Ameritron ICP-240 as an external switch to save the originals on my L4B and L7 amps. While I don't care to comment on that switch as a transient suppressor, I can say with confidence that it is not a soft start circuit in functional, practical sense of the term. Why?

The design of the ICP-240, at least the ones I bought 2-3 years ago, are such that the relay closure time is determined by the first time the input sine wave reaches a particular value. With a 60 hz source, a single AC cycle is approximately 17 milliseconds. So sometime within about a half cycle (depending on phase) that results in about an 8.5 millisecond delay. Then you have the pull in time of the armature of the relay which is another small delay. Needless to say, the tube filaments have not warmed up and the HV capacitors have not had enough AC cycles to fully charge either. Hence, while there is some very, very slight delay, it is not enough to have a practical, functional effect on the onset surge. So in a very strict interpretation of the term, there is a small delay and that might keep the device from falling into the category of false advertising.

I called Ameritron (MFJ) a couple of years or so ago and the knowledgeable gentlemen I talked with confirmed that my analysis was correct. To my knowledge, there has been no change to the design nor advertising. If I am incorrect, I'd like to know about it.

Please note that my reason for buying the ICP-240 was just to use it as an external switch for my amplifiers and for that purpose it satisfies my needs. As a soft start, not so much. Too, if one wants to rebuild the switch assembly on the L4, L4B, and L7, it isn't all that difficult due to the rebuild kit available online. With this approach, you might just get yet another 30-40 years out of the amp's switch.

Enjoy those Drakes.

73,

Evan, K9SQG

For decades I have heard it said that letting the Eimac 3-500Z tubes develop some anode color once in a while
would prolong their life by gettering. Makes good sense so I have done that with my Eimac tubes.
But what about the newer graphite anode 3-500ZG tubes ? I called RF Parts (who market those Chinese tubes)
and the techs there have no idea whether there is gettering on the graphite anodes or not !
So not sure if anode color does them any good.

As for the thread on soft start for the L-4B .... Ameritron makes a soft start for $80 that eliminates the need to
do any mods to the classic amp and also eliminates the need to toggle the fragile L-4B power switch at all.
check out the Ameritron ICP-240 gl Jim

Came to me..... Zirconium is the material I was trying to recall. Initially it
was alloyed into the metal anode, but later and I believe
up until the end, was coated on the outside of the Plate. It must be heated to
at least dull red to work, again giving rise to the
longevity of the tube being related to how hard it's pushed!

So Platesred, glass/metal seals cooled, recommended Grid current, slightly low
(4.9 VAC) filament voltage.

Eimac called it Pyrovac. It was introduced sometime around 1946. I don't think it was an alloy so much as a combination of coatings on some standard material like nickel. One of the components of the coating is zirconium but other materials are also used. Tantalum was expensive but I think the real reason for switching is that it didn't work that well. Tantalum plates seem to have originated with Heintz & Kaufmann. Both Bill Eitel and Jack McCollugh worked for them. If you look up patents for William Eitel you will find a slew assigned to H&K. One of Eimac's secrets was a type of diffusion vacuum pump they devised that allowed tubes to be pumped out better. The processing of the tube causes a lot of gas to be evolved and it must be removed. The tubes were kept connected to a vacuum pump while being brought to very high heat by RF induction heating. As much gas as possible was removed before sealing off and whatever remained had to be cleaned up by the getter. Some getters work only when hot, some only when there is voltage on the tube, and some continue to work in cold tubes to maintain the vacuum during storage or off times. Coatings on the elements are used in all tubes but the familiar silver coating from sprayed getter is not used on larger transmitting tubes. In general transmitting tubes are pumped down to a greater vacuum than receiving tubes (how do you say increasingly small).

I'll have to look at the schematic of the control circuit to see if what I have will adapt readily as parts wired to a terminal strip.
Of course, nothing wrong with making another circuit board kit either to keep the ES4AC-4PS company
The relays just look "perfect size" for this application. I need to design something to use them
I think the power switch should just switch control voltage and leave the big current in the supply.
I'm doing the same change to my LK-550ZC but there is an abundance of space in that supply. Easy to find parts to fit that one.
I'll take a look see at the L4-PS.

Subject: [DrakeRadio] Drake repair in or around Los Angeles?

I have a set of B-Twins and the AC4 power supply I've been meaning to ship to Jeff Covelli for service. Only thing is: the shipping out and back is going to cost about $200.

Nothing against Jeff, he's the best, but are there any other service or repair guys around here in So Cal, specifically the Los Angeles area, that are knowledgeable about Drakes?

Thanks, guys!

Bill, NK6Q
Pasadena

This has been very interesting reading. I talked to him a while ago and his argument is really based on observation, not science.

He claims he has to change rather low hour 3-500z tubes with the same story from the owner who is in disbelief that they failed because they never ran the amp over 600 watts. On the flip side he claims people who are net controls and rag chewers every day and run a full 100 watts drive and tune for max smoke, get much longer life and brag to him how many years they ran the tar out of those tubes. Go Figure! He does and has worked on high power amps for a long time so has a lot of historical data.

I think I will not worry and run my tubes conservatively as $300 plus is a lot of change right now and my current tubes are healthy and do more power in the L-4B than is expected if driven with more than 80 watts with low grid current readings.

Thanks All,

Gary K4MT

It would be interesting to know the failure mode of the
short life tubes, do they get gassy or is it something else.
Low cathode emission could be a sign of gas because gas can
"poison" the cathode. I have not seen anything showing the
absorption rate of getter coating on plates vs: temperature.
I am sure such information exists but its not in any of the
material I have access to. Tantalum seems to need high
temperatures but I don't know about other materials like
zirconium. Someone wrote that Eimac recommends that the
triodes used by Drake be run with the plates showing some
color.
I think its interesting that external anode tubes do

not seem to have this problem (if it is a problem) but they
use different gettering means.

14528. Problem with NB and Cal Positions

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-30 06:48:24 UTC
From: rdl014
Topic: 14528 Message: 14528

I have recently acquired another Drake R-4B receiver that appears to be in good shape and receives with no problems. My concern is with the Function knob. When I turn the knob to STBY the S meter needles swings over to the max position as it should and no sound. When I move it to ON, I get sound now that I have made and added a shorting RCA plug for the mute plug and the S meter needle moves appropriately. In all other positions: EXT MUTE, NB AND CAL positions, the S meter needle again moves over the max position and I get no sound at all.

Anyone have this problem before and any suggestions as to where I need to start checking?
TNX and 73, Ray AK4RL

You need a shorting plug in the "MUTE" socket on the rear panel.

Ray -

If you plugged your 'shorted' RCA plug into the MUTE jack, sounds like it's not really shorted!!

If the plug IS really shorted, then the jack wiring is open.

The ON position does NOT require the shorting plug to function.

14531. AC-4 Power Supply with AC-4R Kit Wanted

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-06-30 16:32:23 UTC
From: w8cq
Topic: 14531 Message: 14531

Hi All,
I am looking to purchase an AC-4 power supply with the AC-4R upgrade kit installed for a Drake station I am setting up here.

Please call 567-203-9327 or email w8cq@...

Thanks,
Jeff W8CQ

Check for good contact at the shorting plug. You can tighten them back up with needle nose pliers by squeezing the central part to make it right again.

Anyone have an AM filter for an R-4C they would consider selling? If so please contact me directly off the listserver with details.

Thank you!
